Descriptive Report to Accompany Tracings from Topographic Sheets.

Nos. 340-397-341-396-556-467-

Showing Changes for Chart publication and revision

The work, of which these tracings show the result, was done in compliance with instructions dated March 26th 1910 and subsequent supplemental instructions.

The tracings are from photographic reproductions of the original sheets, and while the projection on them does not closely fit the projections on the original sheets, the discrepancy is small and will cause no especial difficulty in the transfer or reduction of the features shown.

The method of indicating the changes and additions to be made on these sheets, so far as known, is new. Its use saves about 50% of time to the officer in the field, over making a complete sheet from the original sheets and the data to revise them to date.

The use of the two tracings will take not more than 10% more time to make the reduction from than if a complete new sheet were drawn.

It was expected that the black tracing should be placed over the original topographic sheet and

the tracings in red ink so placed as to be seen and used as a guide for omission and change in the original sheets.

The shore line south and east of Annisquam is composed of solid rock in place or the beach is fronted with large and numerous rocks. There is no change in its position, except where there are short stretches of sandy shore. The shift in position is only about 30 (thirty) metres, since 1850 to 1853. The shore line west and north from Annisquam is sandy and the change is somewhat greater. Along the shores of Castle Neck, from 1 to 2 metres per year. The greatest change noted is the inside of the lower (southern) end of Plum Island. When the change has been 435 metres since 1853, about 8 metres per year. The improvement in the alignment of roads, the building of houses, and the extending of the Boston and Maine railroad from Gloucester to Rockport are the changes noted.

This region is most attractive a a summer residential section. Numerous homes, cottages hotels and boarding houses serve a summer population of from 20, to 30,000 during the season. June to October.

Roads constructed under supervision of the Massachusetts Highways Commission and the City Engineer of Gloucester, are numerous and well constructed and are kept in

Excellent repair, being constantly surfaced and oiled during the summer months.

Rail communication is excellent, the Boston and Maine railway furnish excellent service over the Gloucester Branch to Gloucester and Rockport, and over to Essex branch to Essex and Conoma.

Passenger service between the towns of Beverly, Essex Ipswich Gloucester and Rockport is afforded by the Boston and Northern Electric road.

The Gloucester and Boston steam boat line, have a daily steamer throughout the year and a double daily service, during the summer months.

Gloucester is the first fishing port of the country with a population of about 20,000. The schooners, in which the fishing is done, are exceptionally well built and heavily sparred, they fish from Cape Charles to Greenland. The curing and preperation of fish for food, and the manufacture of glue from the offals etc of fish are the main industries.

There are numerous quarries for granite paving stone and for structural purposes in the vicinity of Rockport Lanesville and Annisquam. A special report as to needs for additional hydrographic surveys, as directed in supplemental instructions is submitted.

Topographic Sheet No 340a

Descriptive report, to accompany tracings from the original sheet, by E.B. Latham, Assist., Chief of Party.

These tracings (two) in red and black ink show; the one in red; such topographic features as either no longer exist or are found to be of different form, from that indicated on the original sheet. The tracing in black shows new and changed topographic features. The topography of the region will be correctly shown by making the erasures indicated, on the original sheet and on such charts as are effected by sheet No 340, and then adding the objects etc shown on the tracing in black ink.

The shore line at the sand beaches and marsh area has slightly changed in position and form. The old roads and houses are practically unchanged from positions as shown on the old sheet, the new roads etc are indicated, on the above mentioned, tracing in black ink.
