(RS 432 to 11158
(RS 430 to 11157

SUBJECT: Project Ph-101, Chesapeake Bay, Virginia

1. Project Ph-101 consists of ^{18 to be detailed} sixteen 1:10,000 scale shoreline surveys (T-11046 to T-11061, inclusive) covering the western shore of Chesapeake Bay and adjacent inland waters from the Potomac River to the Paukatank River.
2. Compilation will consist of shoreline delineation and location of hydrographic signals and delineation of major road changes that have occurred since publication of the War Mapping quadrangles of this area. Only the actual shoreline shall be delineated, no details are required inshore of the mean high water line, except road changes which can be determined by visual comparison of the photographs with the original maps.
3. The purpose of this compilation is to provide shoreline and a means of control for hydrographic surveys. The office photographs and original compiled manuscript maps will be forwarded to the hydrographic parties for use in locating signals by field plotting. During office compilation, conspicuous, positively identifiable natural objects that will obviously be useful as hydrographic signals shall be identified on the photographs and located by radial plot. This shall be done without field inspection.
4. Field inspection shall be held to the minimum required for the above-stated compilation. Some of the horizontal control stations were recovered prior to photography and marked with ground targets intended to be visible on the photographs. Please inspect the photographs and the accompanying project layout and determine if any additional control must be recovered and/or established, and identified. Minimum shoreline inspection by sampling can be accomplished at the same time.
5. After the control requirements have been determined, please consult with me concerning the field work. Personnel may be detailed from the Baltimore Office, but it is preferred to accomplish the work with Washington Office personnel if practicable.
6. The following data will be provided:
 - a. Projections on acetate.
 - b. Office photographs (single and nine lens, October 1952).
 - c. G.P.'s and descriptions of control.
 - d. Project diagram (photo and control index, sheet layout, etc.)
 - e. Prints of War Mapping quads (for comparison).
 - f. Field identification data re: recovered horizontal control.

Chief, Photogrammetry Division

Review of Shoreline maps, Project 27130 (Va. & Md.,
Mobjack Bay to Potomac River)

It is my understanding that the project instructions call for the compilation of any new roads or road realignments in the project area, but that compilation has actually been limited to shoreline and signals for hydrographic support and has not covered any interior details.

In view of the press of work now on hand, I do not think that we should compile additional information on these maps. If such is needed for a chart revision, Mr. Brooks' Unit can take care of it as a chart correction job.

In reviewing the project, please be concerned only with the shoreline and information for hydrography and ignore the omission of interior details.

L. W. Swanson, Chief,
Photogrammetry Division

*Amends per 2 of project instructions
dated 12 Nov 1952.*

PHOTOGRAMMETRIC PLOT REPORT
Project Ph-101
Shoreline Sheets T-11157, 11158 & 11161

(Refer to Radial Plot Layout Sketch, Page)

Area Covered.- This radial plot covers the area of shoreline sheets T-11157, 11158 and 11161 and is situated along the west shore of Chesapeake Bay between New Point Comfort and Gwynn Island.

The radial plot was constructed directly on the 1:10,000 scale map manuscripts. The manuscripts for T-11158 and T-11161 were ruled with 30-second interval polyconic projections on acetate. T-11157 was ruled on vinylite with both polyconic projection and Virginia South Grid. (Job request specified only polyconic projection on acetate.)

Photographs were ~~single~~ nine-lens positype prints at 1:10,000 scale. All ~~single~~ ^{16x2} ~~single~~ photographs were taken October 1952 with the exception of nine-lens photographs 34760 and 34762 which were taken February 1952 and were originally used in the radial plot of Ph-86. These last two photographs were considered necessary to strengthen the south portion of the plot where there was only one flight of the new photography.

Photograph preparation was accomplished with the large prism stereoscopes utilizing the "floating circle method" in the transfer of points.

Unadjusted acetate templets with GPO ink rays were made for all photographs. After consideration of all factors involved, it was felt that use of the Master correction templet was not justified.

The templets were laid down to the control without an unusual amount of effort, holding all control within 0.2 mm, and also holding a selection of pass points and photograph centers transferred from the Ph-86 radial plot within 0.4 mm. The templet ray intersections locating pass points were considered adequate considering the slight distortion errors in the photographs not corrected by master templets and the acetate material used for manuscripts and templets.

Adequacy of Control.- (Instructions for this project are contained in Office Memorandum, dated 12 November 1952, 73-mk1.) Horizontal control provided for this plot was adequate and all stations were held within 0.2 mm.

Horizontal control identification was provided from the following sources:

Horizontal control marked just prior to photography by Ensign Romero and later pricked on the office photographs from memory, rough field notes and sketches.

1944 field identification of control for War Mapping Project CS-289.

Office identification of control marked by hydrographic signals built during the summer of 1952 on Ph-86.

Field identification accomplished by personnel from the Graphic Compilation Section in December 1952.

Photography.- The photography was considered adequate with the above-average amount of control.

COMPILATION REPORT
Project Ph-101
Shoreline Sheets T-11157, 11158 & 11161

The shoreline was compiled in accordance with Office Memorandum, dated 12 November 1952, 73-mk1.

An office selection of hydrographic stations was made and are listed in "Notes to Hydrographer". It is believed that ample stations have been office-selected to control hydrography with few exceptions. To provide this density it was necessary to supplement conspicuous natural objects by selection of small bushes, points of marsh ponds, etc. Those hydrographic stations not located as pass points were cut in as detail points with three, or more, cuts.

The following 1944 topographic stations, originally located on War Mapping Project CS-289, were relocated in the radial plot and new positions in red ink are shown on the Forms 524 with a note of explanation.

T-11161:

None

T-11158

ALLEN (1944) 1953
BARE (1944) 1953
CLAUD (1944) 1953

T-11157

CALL (1944) 1953
ALBE (1944) 1953
FISH (1944) 1953
GULF (1944) 1953
HURST (1944) 1953
TRAV (1944) 1953
TWIN (1944) 1953

Aids to Navigation located by the radial plot are followed on the manuscript with a 1953 date. Aids that could not be office-identified on the photographs are plotted from their 1944 positions. Forms 567 are not submitted for these aids because the new radial plot position should be first verified by the hydrographic party.

Compilation was accomplished without the benefit of field inspection and detailing was further handicapped by poor scale photographs and by the early-morning (9:00 AM) photography.

NOTES TO HYDROGRAPHER
Project Ph-101
Shoreline Sheets T-11157, 11158 & 11161

Hydrographic signal sites have been located and described briefly on the field photographs. It must be remembered that the office photogrammetrist has attempted to select a sufficient density to control the hydrography without the benefit of field inspection. Description of the pricked detail may be in error but when used along with the field pricking it is believed that such detail can be recovered and positively identified on the ground. There will be some gaps in the numbering of hydrographic signals because some were rejected in the subsequent process of transferring to the office photographs and locating them on the manuscripts.

Where objects such as lone trees, gables, ends of piers, etc. were selected that do not require erection of signals, it will be necessary for the field photogrammetrist to revise, or supplement, the office description of the object.

If enough office-selected hydrographic signals can not be recovered for hydrographic control, it is believed that additional signal sites pricked in the field can probably be located by simply transferring to the best-scale photograph of the area and then pricking it on the manuscript by holding adjacent hydrographic signals and/or passpoints. It will be necessary to keep the manuscript location of the photograph center on a radial of the photograph in the direction of the signal being located. If the scale of the best-scale photograph is too poor for direct pricking, it will be necessary to locate the additional signals as detail points in accordance with paragraph 463, Part II, Topographic Manual (Sp. Pub. No. 249).

For the inexperienced man to learn the proper evaluation of a satisfactory photographic scale for direct pricking of the additional signals he can check his direct pricking by locating the same object in accordance with paragraph 463 of Sp. Publ. No. 249.

In addition to a field verification of office-identified hydrographic signals, topographic stations, and aids to navigation; the hydrographer should be alert for major discrepancies in the shoreline delineation, especially around inlets and along streams with tree overhang.

After verification of the location of aids to navigation in the field it will be necessary to submit forms 567 for these aids, and to correct the 1944 forms 524 for these aids.

A listing of hydrographic signals by field photographs and sheets follow these notes.

REVIEW REPORT
T-11157 T-11158 T-11161
Shoreline Survey
February 28, 1957

62. Comparison with registered topographic surveys.

T-503	1:20,000	1853
T-2715	"	1905-1906
T-2869	"	1907-1908
T-8328	"	1942-1945
T-8329	"	1942-1945

For the area which they cover, the manuscripts supersede these surveys for nautical charting purposes.

63. Comparison with maps of other agencies.

USGS New Port Comfort, Virginia Quadrangle	1:24,000	1944-45
USGS Mathews, Virginia Quadrangle	1:24,000	1944-45

(T-8328 and T-8329 were the base maps for these quadrangles).

64. Comparison with contemporary hydrographic surveys.

H-8078	1:10,000	1953
H-8079	1:10,000	1953
H-8080	1:10,000	1953

The hydrographer states that the shoreline as compiled is correct.

Form 567 was prepared and forwarded to the Nautical Chart Branch by the hydrographer; Chart Letter 1123 (1953).

65. Comparison with Nautical Charts.

Chart 494	1:40,000	7th edition	8/22/55
Chart 534	1:40,000	3rd edition	7/2/55
Chart 1222	1:80,000	15th edition	10/10/55
Chart 1223	1:80,000	5th edition	8/22/55

66. Map accuracy

The map manuscript conforms with the National Standards of Map Accuracy and project instructions as amended.

Cartographic Branch

11 March 1957

Chief, Photogrammetry Division

Review of Shoreline Maps, Project 27133 (Va. & Md.,
Mobjack Bay to Potomac River)

It is my understanding that the project instructions call for the compilation of any new roads or road realignments in the project area, but that compilation has actually been limited to shoreline and signals for hydrographic support and has not covered any interior details.

In view of the press of work now on hand, I do not think that we should compile additional information on these maps. If such is needed for a chart revision, Mr. Brooks' Unit can take care of it as a chart correction job.

In reviewing the project, please be concerned only with the shoreline and information for hydrography and ignore the omission of interior details.

L. W. Swanson, Chief,
Photogrammetry Division
