Pastol Bay Topog^c Sheet, Alaska

Descriptive Report

The region covered by this sheet lies between Point Romanof and entrance to Pastoliak River. The immediate coast line is low, but just back from the coast the ground gradually rises to the foot hills of the mountain range. The water along Pastol Bay is shoal, with soft muddy bottom, deepening very gradually to seaward. The land is covered with a growth of moss and tundra to the base of the mountain range, and is totally devoid of timber of any kind.

Natives are seen along the coast in summer hunting and fishing, but there are no permanent habitations. Some driftwood is found along the coast, which is utilized by the natives for fuel. Wind, Weather and Climatic conditions similar to those already published for Norton Sound region. This region has been previously described by Assist. J. F. Pratt, in his Survey of 1898.
