Descriptive Report

of

Topographic Sheets No's 1, 2, & 3.

Tlevak Strait,

S.E. Alaska.

Executed during the season of

1912.

Note:

The control of the topography shown on these sheets is based upon the triangulation of Tlevak Strait, executed in 1906 by the Party of Asst., E.F. Dickins.

In small bights and bays not reached by the triangulation a number of flags and temporary marks were made and located by plane-table cuts. The positions of these temporary marks were transferred to the hydrographic sheets direct. A list of these flags with their geographic positions was compiled by Aid Joachims and is attached to this report.

R.B. Aterton

Chief of Party, C. & G. Survey.

Descriptive Report to accompany Sheets No's. 1, 2, & 3.

LIMITS.

This work comprises three topographic sheets, two of which are on a 20,000 scale, and the other on a 10,000 scale. A line drawn from Howkan Village to Lacey Islands forms the limits of the work on the south-east end. The work extends from this line in a north-westerly direction to the north shore of Mears Passage. The topography extends back inshore from one half to two miles, varying with the character and lay of the land. The area comprises all of Tlevak Strait, Tlevak Narrows, part of Ulloa Channel, part of Mears Passage, most of the shore-line adjoining Tlevak Strait, and many bays, inlets, and groups of Ids.

GENERAL DESCRIPTION.

The topography of this section is very irregular. The coast is indented by many bays, creeks, inlets, etc., and the water area is dotted with many islands, rocks, and reefs. In general the coast is bold, rocky and precipitous. In most places deep water extends close into the shore and islands. Practically all the land is heavily timbered with spruce, hemlock and cedar. Some of the high mountains which are visible but not included in the area, covered by the sheets, are treeless and of a whitish cast. The ledges along the shores of Dall Island, and many of the smaller islands, is marble of an inferior quality. The hills and mountains are steep and some of them are more than two thousand feet in elevation. Fresh water is abundant, and there are many landslides.

ISLANDS AND ROCKS.

There are many islands and rocks extending westward from Shoe Rock along the northern end of Long Island. The Channel Islands are two islands connected by a reef near Howhan Village. There is a large group of islands in the south end of Tlevak Straits, the largest of which is Grand Id., and there are several navigable passages between these islands. The McFarland Islands, Corlies Islands, Nichols Islands, and Lively Islands, consist of several large and many small islands, rocks, and reefs, and deep water extends close inshore. There are many other islands and rocks which need no description as they are all shown on the sheets. There are practically all heavily wooded and are from twenty five to two hundred feet in elevation.

BAYS AND INLETS.

North Bay is a long bay about three miles south of Tlevak Narrows. There is an anchorage in the south-west end of this bay but it should only be used in cases of necessity in heavy weather, as the winds draw through with great force and the holding ground is not good. Rose Inlet is a large bay in Dall Island with a number of islands at its mouth. There is a large salmon cannery at the head of this bay and vessels should make the approach with caution in order to clear the reef which lies out from the wharf. Kasook Inlet is a bifurcated bay and there is a sheltered anchorage in the east fork. Vessels can also anchor in Grace Harbor and Vesta Bay but they draw more or less winds in south-east weather. Owing to lack of time much of the topography of View Cove, Coco Harbor, Baldy Bay, Dunbar Inlet and Soda Bay was omitted.

TLEVAK NARROWS.

Tlevak Narrows locally known as the Skookum-Chuck, is a narrow body of water connecting Tlevak Strait with Ulloa Channel. There are a number of islands and small inlets both north and south of the Narrows. By estimation the current runs from three to six knots through these Narrows causing many whirlpools and eddies. There is a wooded island in the middle of the Narrows forming two channels. Vessels may pass through the west channel at most times by careful navigation but the east channel is obstructed by reefs and should be avoided at all times. Shortly after passing through the Narrows the strength of the current is greatly diminished. The reefs and rocks in this vicinity are all shown on the topographic sheet and no special description is deemed necessary.

HEADLANDS AND POINTS.

The headlands are mostly ~~area~~ all bold and abrupt. Turn Point in Tlevak Narrows is an abrupt point rising to an elevation of about 300 feet. Cayman Point, between Farallon and Noth Bays, is a little more than 1100 ft. ^{east} in elevation. The north end of this headland is known as Cayman Point and is divided from the main headland by a low pass. The headland between Farallon Bay and Breezy Bay is bold and irregular, and rises to an elevation more than 1500 feet. Eolus Point is bold and irregular and is a little more than a 1000 feet in elevation. Reef Point is a long point projecting into Tlevak Strait just above View Cove. This point is about 420 feet at its outer end and a little over 800 feet about a mile back. High Point is bold and rounded and is about 1700 feet in elevation. The headlands between Rose Inlet and Vesta Bay also between Vesta Bay and Grace Harbor are high and prominent. Halibut Nose is irregular and not so high and prominent as some of the other headlands.

WEATHER.

The weather in this section varies and probably only a few general rules can be applied which would hold true for any considerable period of time. Like most all of this section of Alaska there is an abundance of rainfall. Clouds hang low and there is more or less fog. A heavy Scotch mist, almost as dense as fog, often envelopes the surroundings. During the summer months the weather is comparatively good, but in October the south-east gales start in and continue with more or less frequency throughout the winter months.

SURVEY METHODS.

The work on these sheets was all done with plane-table. The contours are approximate and represent the general topography of the land. Elevations were taken by intersections on the tops of peaks and the contours were sketched from these. Work was carried on during heavy rain showers, and at times the sheets got very wet, therefore, they are somewhat distorted. As will be seen from the different sheets, some of the shoreline was omitted owing to lack of time. The shoreline is considered very accurate and the same amount of attention was given to all of it.

Respectfully submitted,

John W. Maupin,

Asst., C. & G. Survey,
Topographer.

Projections made and triangulation stations plotted in field
by J.W. Maupin, Assistant.

Topography on sheet #3 done jointly by Asst. Maupin and Aid
Joachims.
