DESCRIPTIVE REPORT TO ACCOMPANY TOPOGRAPHIC SHEET ~~A2~~ 3448

WARM CHUCK , HECETA ISLAND ,
W. COAST , PRINCE OF WALES ID.
S . E . ALASKA.

This sheet is a planetable survey of Warm Chuck, the bay that makes into the southern part of Heceta Island , between Bocas de Finas and Tonowek Narrows. The control is triangulation at the mouth of the bay and planetable triangulation and traverses to the head. The scale is 1 to 10,000.

The shoreline is similat to the Southeast Alaska shoreline , a succession of steep to shores and shingle beaches. There are mud flats at the heads of the arms of the bay, as shown by topographic symbols on the sheet. The shores are densely wooded with spruce, pine cedar and other coniferous woods, interspersed with alder and birch. Berries are plentiful, especially near the heads of the bay.

The contours are sketched in , the elevations being given to the tree tops but the contours showing the ~~grend~~ ground. Whenever the peaks are bare, e.g. above ²⁰⁰⁰ ~~1500~~ feet in elevation, the contours show the actual ground and the elevations are to the summits. The tree height was assumed to be 100 feet at the hilltops after a number of determinations.

There are no creeks of any importance making into this bay although there are a few small ones. Water may be obtained at Swifts Cannery where it is piped to the dock. This is a small cannery , putting up a pack of 10,000 cases a year.

The rock formation is volcanic throughout.

Respectfully,

Nelson W. Smith *aid.*
