DESCRIPTIVE REPORT

to accompany

TOPOGRAPHIC SHEETS

- G - H - I -

SHINNECOCK and MORICHES BAYS, NEW YORK.

Project No. HT-133 - A. P. Ratti, Chief of Party, 1933.

Authority -- Director's instructions dated Feb. 25, 1933.

Extent -- These sheets comprise a survey of the ocean shore line and inland bays from Southampton, N.Y. to Center Moriches, N.Y. including the new inlet to Moriches Bay.

Survey Methods -- The entire territory was surveyed by the standard Coast Survey plane table methods. This survey was controlled by triangulation stations established and located by A. P. Ratti in 1933. Since aerial photographs were taken of this territory special attention was given to the location of signals for hydrography so their position could in general be readily spotted on the photographs to furnish control in compiling these photographs.

No traversing with the plane table was necessary since it was possible to cut in signals from across the bay and so locate each one accurately with three or more cuts.

Description -- The entire ocean coast line is outlined with a range of grass covered dunes varying in height from about 10 to 30 feet. At several places, notably near the towns of Southampton, Quogue and Westhampton Beach a great many residences are on top or just behind these dunes. A paved highway parallels the ocean shore line in back of these dunes from Moriches Coast Guard Station to Southampton. The narrow strip of land between this highway and the inland bays is mostly a grass covered marsh which in most places is covered by a few inches of water only at extremely high tides. With a very few exceptions the edge of this marsh is well defined. All of this marsh land is cut up by a great many drainage ditches as an aid to mosquito control.

The new inlet west of Moriches Coast Guard Station is constantly shifting and the sandy shore line both on the ocean and bay sides is subject to constant change. The entire ocean shore line is also naturally subject to continual change by wave action during storms.

The inside or northerly shore of Shinnecock Bay from West Pond to Shinnecock Canal shows a range of grassy hills of from 60 to 120 feet above sea level. Also just west of Cormorant Point the shore line is a tree covered bluff. Practically all the rest of the shore line of both Shinnecock and Moriches Bays is low, often marshy, and in some places wooded.

Remarks -- Comparison of sheets with Chart 578 show many minor changes but no prominent differences.

Supplementary Report on

T. 4765 and T. 4764.

Chief of Party - A. P. Ratti.  
Surveyed by - D. S. Ling.  
Date - April - June 1933.  
Scale - 1:20,000.

The following report is based on a comparison of plane table control sheets T. 4764-5 with air compilation sheets T. 5080 and T. 5082.

The projections of T. 4764-5 were out in places as much as 3 meters - probably due to not drawing the lines through the measured points, these points in cases being as much as 5 meters in diameter.

In comparing the plane table control and the air photo compilation sheets several signals did not agree.

© Cut did not check by 11 meters. A close examination of the plane table sheet shows the intersection of cuts outside the position as used on the sheet. The position hole is about 3 to 4 meters in diameter.

© Bum is evidently in error about 18 meters as indicated by the descriptive report of T. 5080 paragraph B as this position was checked by the hydrographic party which party took sextant cuts to 3 triangulation stations to locate same. The hole for this signal is about 10 meters in diameter.

© Dew and © Abe are in error 9 and 12 meters respectively according to the radial plot. This may be caused by the fact that the holes for these signals on the planetable control sheet are about 8 meters in diameter.

© Pan - The cuts seem to intersect outside the actual hole of the signal. Here again the hole is very large.

© Art - The hole is very large and off to the side of the center of the circle.

△ Header - The hole is very large as is also the case on © Let, © Fat, © Cam © Map and several others. It is felt that the size of these holes might lead to an error in orientation and consequently in the locations of other signals or other topographic features.

For practically the entire length of the sheet T. 4765 the high water line on the plane table control sheet does not agree with that of the air photo compilation. In places it does not agree by as much as 40 meters. In places the hydrography would indicate that the high water line as shown on the plane table control sheet to be correct whereas in other places the air photo compilation sheet may be correct.

Supplementary Report on T. 4765 and T. 4764.

On the attached blueprint the plane table control high water line has been shown in red and the inside line of soundings in yellow.

It is felt that more care should be taken in pricking the holes on the plane table control sheet and also in pricking the intersection of any cuts. Where signals are located by intersection the cuts should be left on the sheet to better enable the reviewer to decide which position of a signal should be adopted.

The photographs were taken and the plane table topography was executed prior to the storm on August 23-24, 1933 but the hydrography was done August 31-September 28, 1933.

Submitted by - Charles R. Bush, Jr.

80-DRM

February 26, 1934.

To: Lieut. A. P. Ratti,  
U. S. Coast and Geodetic Survey.

Through: Commanding Officer,  
U. S. Coast and Geodetic Survey,  
Ship HYDROGRAPHER,  
P. O. Box 702,  
Port Arthur, Texas.

From: The Director,  
U. S. Coast and Geodetic Survey.

Subject: Criticism of topographic surveys of Long Island.

It is desired to call your attention to several points of criticism made in reviewing the topographic surveys executed under your direction on Long Island by Mr. D. S. Ling. These refer to T. 4763, 4, 5, 6, 7 and 8.

1. The scale, 1:20,000, used on sheets T. 4764, 5, 6 and 7, was too small for the purpose intended.
2. No descriptions of recoverable stations were accomplished on Form 524 for any of these sheets. On several sheets which included bridges, pencil notes were made relative to span and clearance. The statement covering these features should have been included in the descriptive report.
3. From an examination of the projections it is found that the lines were out as much as three meters, probably due to carelessness in drawing them through the measured points.
4. These sheets were in the main intended as control sheets for the compilation of aerial photographs. In the case of several of the sheets the compiler reported that considerable difficulty was found in the first plot, due to errors in the location of topographic signals. It was found that signals were in error on the control sheet from 8 to 23 meters. A typical case is that of signal "Bum" which was indicated as 18 meters in error on the photo compilation sheet. This position was checked by the hydrographic party,

which party took sextant cuts to three triangulation stations to locate it. The errors were not due to errors in traverse, because adjacent signals were found satisfactory.

5. An examination of the sheet shows that the centers of many signals were pricked with holes 8 or 10 meters in diameter; also that the points pricked for the centers of some signals were not at the intersections of cuts to them. Considering the diameter of the holes in several of the triangulation stations it is not understood how any accuracy could be obtained in orientation.

6. The surveys show an amount of carelessness which should not be tolerated in the use of the aluminum backed topographic sheets.

(Signed) J. H. HAWLEY  
Acting Director.
