REPORT OF COMPILATION

FOR

AIRPHOTO COMPILATIONS NOS. 5471 & 5472

Norfolk, Va., 1936

This report is written to cover two adjoining compilations of the same scale factor which were radial plotted as a unit. The general characteristics of both sheets are the same.

CONTROL:

After the field inspection of existing control was completed, it was apparent that it would be necessary to establish additional control in order to run through a fixed plot. In this connection, two short, closed traverses were run in with theodolite (6 D & R) and tape. Traverse # 1 on compilation 5471 between triangulation stations Pleasant & Turnpike closed with an error of less than three (3) m., which was adjusted. Traverse #2 on compilation 5472 between Pungo and North Landing, closed with an error of less than two (2) meters and was adjusted.

With the combination of traverse and triangulation control, it was possible to run through fairly well fixed plots with the assurance that compilation in the critical areas was well controlled and accurate.

RADIAL LINE PLOTS:

The preliminary scale plot showed the photographs to be of approximately the same scale for the four flights which covered the two compilations, so a mean scale factor of 0.97 was adopted. This made it possible to join the two sheets together while running the radial plot and thus take advantage of all control in the overlapping flights along the sheet junction.

The photos for compilation 5471 were new and were flown with a camera in good adjustment. The photos for compilation 5472, however, were flown over two years ago and were taken with a camera known to be out of adjustment. For this reason it was advisable to run the overlap or junction plots together so that a careful check could be made. This junction area had very little control except the traverse but the plots went through fairly well the first try and subsequent adjustments developed a system of excellent intersections in the flight overlap and assured a smooth, even plot.

ADJUSTMENT OF PHOTOGRAPHS:

The individual photographs varied considerably in scale and most of them were badly tilted - especially on compilation # 5471, so that adjustment of detail was a tedious job. This was particularly so due to the great amount of fine detail such as ditch systems and roads, but the radial points were excellent and by intersecting for additional, break-down points it was possible to run through a smooth, accurate compilation. The photo detail was generally clear.

Accuracy

The probable error of location of 2 to 3 mm. noted on the opposite page applies to the north limits of these compilations.

With the traverses mentioned on page 1 of this report, the control along the canal and north to lat. $36^{\circ} 44'$ on T-5471 is ample and the accuracy of location of well defined detail is accepted as within 1 millimeter. From lat. $36^{\circ} 44'$ northward, there was practically no control. The photo plots which are in a north-south direction do not close on control above $36^{\circ} 43'$ and could be checked only by tying in with the plots of the adjacent compilation T-5149 which was well controlled.

On T-5471 the detail above lat. $36^{\circ} 46'$ will not be published except for a small portion at the west edge.

On T-5472, the detail above $36^{\circ} 45'$ will not be published except for a small portion at the west edge.

B. J. Jones

FIELD INSPECTION:

The field inspection was carried on by the writer and one draftsman and was easily accomplished by truck. It was impossible to penetrate the heavily wooded areas to determine the amount of land which is normally flooded and since this feature does not show on the phototbgraphs it was impossible to show by the conventional water-line symbol the area which is actually swamp.

All heavily wooded areas in this section of the country are classed locally as "swamp" because most of the higher ground has been cleared for cultivation. All of the land is very low and flat and the fields are closely ditched for drainage. Much of the so-called "swamp" is actually dry a greater part of the year altho there is considerable cypress growing in the areas adjacent to the waterways. The bulk of the timber is gum with a mixture of pine, oak, maple, beach, et c. on the higher ground.

INTERPRETATION OF DETAIL:

The photographs were quite clear and with the use of the stereoscope it was possible to identify and locate most of the large buildings and special structural features. The ditch systems show up clearly in the cultivated areas because of the growth of grass and low brush lining the banks. There were no unusual features and no special symbols used.

COMPARISON WITH CONTEMPORARY SURVEYS:

The only comparison possible was made with planetable sheet #6362, R. P. Eymann, 1934, showing the upper reaches of the North Landing River which appeared on compilation 5472. The check was excellent where the shoreline was rodged in on definite points and islands and the mouths of tributary streams but there were numerous, small discrepancies between rodged points where the topographer had sketched the general outline.

ACCURACY AND COMPLETENESS:

The compilations are complete in every detail as well as can be determined from the photographs. Although the control is not well distributed, the excellent intersections obtained on the radial plot lead me to believe that the maximum error in controlled areas should not exceed two millimeters and in less well controlled areas, three millimeters. *See opposite page*

JUNCTIONS:

All junctions with adjoining compilations are complete.

LANDMARKS: No list of landmarks submitted.

COAST PILOT NOTES: None submitted.

BRIDGE DATA: Data for all bridges is shown on the overlay sheets as

taken from the publication; List of Bridges over Navigable Waters
of the U. S. - 1934 and verified for subsequent change with the
U. S. E. D., Norfolk, Va.

REVIEW OF AIR PHOTO COMPILATIONS T-5471 and T-5472
Scale 1:10,000

Data Record

1. Triangulation to 1934
2. Photographs to September 1935
3. Theodolite and tape traverses, 1936
4. Field inspection to November 1936

The field inspection indicated that there were no considerable changes in detail and that detail on the compilations is that of the date of photographs.

Comparison with Graphic Control Survey

T-6362a (Jan. 1935), 1:10,000

The compilation^{T-5472} and T-6362a are in agreement except for slight differences in the location of shoreline between rodded points on the graphic control sheet.

Numerous snags, tree stumps, and piles which were shown on T-6362a were added to the compilation along the North Landing River.

There were slight differences in the position of sunken barges at lat. 36° 41.9', long. 76° 04.6'. After checking with the photographs, the position shown on the compilation was proved correct.

There are no contemporary hydrographic surveys in the area covered by this compilation.

Comparison with Topographic Surveys

T-1387 (1873), 1:20,000

T-3250 (1912), 1:10,000

There have been slight changes in the locations of shorelines of numerous streams. The ~~alignment of the~~ Albemarle and Chesapeake Canal has been improved by eliminating several bends in the North Landing and Elizabeth Rivers where these streams are included in the Intracoastal Waterway.

Changes in structural features have taken place in the locks near Great Bridge.

This compilation is complete and adequate to supersede the above topographic surveys for charting.

Comparison with Charts 452 (1:20,000) and 1227 (1:80,000)

These compilations show additional roads and a number of small changes in shoreline as compared with the present charts.

No landmarks have been recommended by the compilation party.

General

A statement of the accuracy of location and additional control has been included in the descriptive report opposite page 2.

All geographic names were added to the compilation in this office.

The field inspection reports that numerous drainage ditches in this area are essential for cultivation and are characteristic of this locality. The land is low and cultivation is possible only in the areas which are a few feet higher than the surrounding swamp and which can be drained into the swamp. These ditches are often covered by brush and hedges and are not apparent on the photographs but the Chief of Party states that these brush and hedge lines are invariably over a drainage ditch.

March 24, 1937.

H. H. Schleiter
B. G. Jones

REVIEW OF AIR PHOTO COMPILATION NO. 5471

Chief of Party: *J.B. Grenell*Compiled by: *J.B. Grenell*Project: *Party #18*Instructions dated: *Mar. 18, 1936*

1. ✓ The charts of this area have been examined and topographic information necessary to bring the charts up to date is shown ✓ on this compilation. (Par. 16a, b,c,d,e,g and i; 26; and 64)
2. ✓ Change in position, or non-existence of wharfs, lights, and other topographic detail of particular importance to navigation which affect the chart, is discussed in the descriptive report. (Par. 26; and 66 g,n) ✓
3. ✓ Ground surveys by plane table, sextant, or theodolite have been used to supplement the photographic plot where necessary to obtain complete information, and all such surveys are discussed in the descriptive report. (Par. 65; and 66 d,e) ✓
Traverse for photo control
4. ~~Blue-prints and maps from other sources which were transmitted by the field party contain sufficient control for their application to the charts. (Par. 28)~~
5. ✓ Differences between this compilation and contemporary plane table and hydrographic surveys have been examined and rectified in the field before forwarding the compilations to the office and are discussed in the descriptive report.
No contemporary surveys for comparison
6. ✓ The control and adjustment of the photo plot are discussed in the descriptive report. Unusual or large adjustments are discussed in detail and limits of the area affected are stated. (Par. 12b; 44; and 66 c,h,i) ✓
7. ✓ High water line on marshy and mangrove coast is clear and adequate for chart compilation. (Par. 16a, 43, and 44) ✓

NOTE: Strike out paragraphs, words or phrases not applicable and modify those requiring it. Paragraph numbers refer to those in the Topographic Manual. Refer also to the pamphlet "Notes on the Compilation of Planimetric Line Maps from Five Lens Air Photographs."

8. ~~The representation of low water lines, reefs, coral reefs and rocks, and legends pertaining to them is satisfactory.~~ (Par. 36, 37, 38, 39, 40, 41)
9. Recoverable objects have been located and described on Form 524 in accordance with circular 30, 1933, circular letter of March 3, 1933, and circular 31, 1934. (Par. 29, 30, and 57)
10. A list of landmarks was furnished on Form 567 and instructions in the Director's letter of July 16, 1934, Landmarks for Charts, complied with. (Par. 16d, e; and 60)
11. ✓ All bridges shown on the compilation are accompanied by a note stating whether fixed or draw, clearance, and width of draw if a draw bridge. ~~Additional information of importance to navigation is given in the descriptive report.~~ (Par. 16c)
12. ✓ Geographic names are shown on the overlay tracing. The accepted local usage of new names has been determined and they are listed in the report, together with a general statement as to source of information and a specific statement when advisable. Complete discussion of place names differing from the charts and from the U. S. G. S. Quadrangles is given in the descriptive report, together with reasons for recommendations made. (Par. 64, and 66k)
No new names
13. ✓ The geographic datum of the compilation is *N.A. 1927* and the reference station is correctly noted.
14. ✓ Junctions with adjoining compilations have been examined and are in agreement. (Par. 66j)
15. ✓ The drafting is satisfactory and particular attention has been given the following:
 1. ✓ Standard symbols authorized by the Board of Surveys and Maps have been used throughout except as noted in the report.
 2. ✓ The degrees and minutes of Latitude and Longitude are correctly marked.

3. ✓ All station points are exactly marked by fine black dots. ✓
4. ✓ Closely spaced lines are drawn sharp and clear for printing. ✓
5. ✓ Topographic symbols for similar features are of uniform weight. ✓
6. ✓ All drawing has been retouched where partially rubbed off. ✓
7. ✓ Buildings are drawn with clear straight lines and square corners where such is the case on the ground. ✓

(Par. 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 48)

16. No additional surveying is recommended at this time. ✓
