SUMMARY TO ACCOMPANY
DESCRIPTIVE REPORT
TP-00264

This 1:20,000 scale final Class III shoreline map is one of two maps that comprise project CM-7211, Valdez Arm, West Side, Alaska. The project originally included a third 1:20,000 scale map (TP-00263) west of TP-00264, but it was canceled because of incomplete photographic coverage.

The purpose of this map was to provide data in support of hydrographic operations and updating of nautical charts.

This map portrays the shoreline along most of the western side of Valdez Arm and the eastern portion of Columbia Bay.

Photo coverage for this map was adequately provided by 1:60,000 scale panchromatic and 1:30,000 scale color photographs taken July 3, 1972. The panchromatic photos were taken with the RC-9 (M) camera and the color photos were taken with the RC-8 (E) camera. The panchromatic photographs were used for aerotriangulation, compilation and photo-hydro support. The color photographs were ratioed to map scale and used in some areas for graphic compilation of shoreline and alongshore detail and hydro support.

Field work prior to compilation consisted of the recovery, establishment, and identification (premarking) of horizontal control necessary for aerotriangulation. Also, the field party was responsible for assisting in obtaining aerial photography. This activity was performed in June/July 1972.

Analytic aerotriangulation was adequately provided by the Washington Science Center in September 1972. This activity also included ruling the base manuscripts and providing ratio photographs for compilation.

Compilation by interpretation of the mapping photographs was performed at the Coastal Mapping Unit, Atlantic Marine Center in November 1972. Photo-hydro support data involving the original Class III manuscript was forwarded to the hydrographer.

A partial field edit was conducted May 1974 by hydrographic personnel assigned to the NOAA Ship DAVIDSON. The area of edit was restricted to the navigable area survey limits of H-9422. Only a quick check of the shoreline for major discrepancies, and the location of some alongshore and offshore rocks were accomplished within the hydro survey limits. This partial field edit data was returned to the coastal mapping office and applied to the manuscript in August 1984.

Final review was performed at the Atlantic Marine Center September 1984. A Chart Maintenance Print was prepared and forwarded to the Marine Chart Branch.

This Descriptive Report contains all pertinent information used to compile this final Class III map. The original base manuscript and related data were forwarded to the Washington Science Center for final registration.

FIELD INSPECTION

TP-00264

There was no field inspection prior to compilation. Field work accomplished was limited to the recovery, establishment and identification (premarking) of the horizontal control necessary for the aerotriangulation of the project.

PHOTOGRAMMETRIC PLOT REPORT
Prince William Sound, Alaska
Valdez Arm, West Side
Job CM-7211
September 1972

21. Area Covered

This report pertains to two sheets on the west side of Valdez Arm near the Port of Valdez, Alaska. The sheets covered are TP-00264 and TP-00265 at 1:20,000 scale.

22. Method

One strip (72-M-1280 thru 1288) of 1:60,000 scale panchromatic photography was bridged by analytic aerotriangulation methods. This strip was adjusted to Alaska state plane ground coordinates, zone 3. Points were established for determining ratios of 1:30,000 scale color support photography. Sufficient points for setting models were plotted on the Coradomat.

23. Adequacy of Control

The control was adequate. All points used in the adjustment were unadjusted field positions. Additional control points were plotted on the manuscripts. The positions for YOKE 1947, HEATHER 1947, DICK 1947 and POLE 1947 were from 1960 published data. All other plotted points are from 1970 published data.

24. Supplemental Data

No supplemental data was used.

25. Photography

The photography was adequate.

COMPILATION REPORT
TP-00264

31 - DELINEATION

Delineation was accomplished using stereo instrument and graphic compilation methods. The Wild B-8 stereoplotter was used to delineate shoreline, alongshore and interior detail based upon office interpretation of the 1:60,000 scale bridging/compilation panchromatic photographs.

Color photographs at 1:30,000 scale were ratioed (1.50 times) to map scale and used to graphically delineate some shoreline and alongshore detail.

All photographs used to compile this map are listed on NOAA Form 76-36B. The photography was adequate.

32 - CONTROL

Refer to the Photogrammetric Plot Report dated September 1972.

33 - SUPPLEMENTAL DATA

None.

34 - CONTOURS AND DRAINAGE

Contours are not applicable to this project. Drainage was compiled by office interpretation of the photographs.

35 - SHORELINE AND ALONGSHORE DETAILS

The mean high water line and alongshore details were compiled by instrument and graphic methods as described in item #31.

No mean lower low water line was compiled due to the stage of tide of the compilation photographs being 4.2 feet and 5.1 feet above mean lower low water.

36 - OFFSHORE DETAILS

Offshore detail was compiled by instrument and graphic methods as described in item #31.

37 - LANDMARKS AND AIDS

There are no charted landmarks or navigational aids within the mapping limits of this manuscript.

TP-00264

38 - CONTROL FOR FUTURE SURVEYS

None.

39 - JUNCTIONS

Refer to the Data Record Form 76-36B, Item 5. This map junctions with project PH-6411.

40 - HORIZONTAL AND VERTICAL ACCURACY

Refer to the Photogrammetric Plot Report dated September 1972.

46 - COMPARISON WITH EXISTING MAPS

A comparison was made with the following U.S. Geological Survey Quadrangles: Anchorage (A-1), Alaska, dated 1960, scale 1:63,360; Valdez (A-8), Alaska, dated 1960, scale 1:63,360; Cordova (D-8), Alaska, dated 1952, scale 1:63,360; and Seward (D-1), Alaska, dated 1952, scale 1:63,360.

47 - COMPARISON WITH NAUTICAL CHARTS

A comparison was made with the following U.S. Coast and Geodetic Survey Chart: 8519, 8th edition, dated May 17, 1965, scale 1:79,291.

ITEMS TO BE APPLIED TO NAUTICAL CHARTS IMMEDIATELY

None.

ITEMS TO BE CARRIED FORWARD

None.

ADDENDUM TO THE COMPILATION REPORT TP-00264
CM-7211

Partial field edit was performed for this map in May 1974 in conjunction with Hydrographic Survey H-9422. Since this hydro activity was a navigable area survey, it was not concerned with shoreline detail. The field edit operation involved the location of some alongshore rocks and a quick check of the shoreline for major discrepancies. All field edit data was abstracted in the edit report.

Edit for this map was done with Mini-Ranger, although sextant fixes were given for comparison. The Mini-Ranger arcs failed to define a point, but scribed open triangles in many cases. The sextant fixes were computed and plotted on the original manuscript. No check angles were given for any of the sextant fixes. Because of this, only data that could be verified on the photographs was applied to the manuscript.

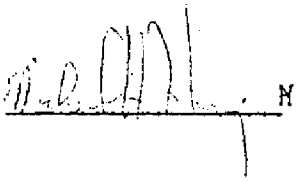
FIELD EDIT REPORT

OPR-999 1974

HYDROGRAPHIC SURVEY # H-9422

Field Number DA-20-1-74

by NOAA Ship DAVIDSON



N.H. Fleming, COMDG

1. INTRODUCTION

Field editing was not a requirement for this navigable area survey of Valdez Arm, from Rocky Point in the south to a mile north of Entrance Point day beason in Prince William Sound. In spite of the fact that there was no requirement, it was decided to quickly check the shoreline for major discrepancies of off-lying rocks that would be a hazard to navigation in this area. This generally consisted of obtaining fixes at the limit of reefs, islands, and points which extended to seaward. Also, no final shoreline plot was available of the area from Sawmill Bay to one mile north of Potato Point. This area is covered on T-12991, and a final (field) plot of the shoreline was made by taking fixes and simultaneous sketches of the beach; then later piecing this data together to obtain the high water line, rocks, bluffs and low water line. (See Section 2 for further explanation of this technique.)

2. METHODS

The shoreline plotted on the final smooth boat sheet came from following sheets:

CM-7211	TP-00264	Sawmill Bay, Alaska (paper Ozalid)
	T-12991	Potato Point, Alaska
	T-12994	Galena Bay, Alaska
	T-12992	Entrance Point, Alaska

TP-00264 was a 1:20000 scale manuscript; whereas, the three T-sheets listed were initially drawn at 1:10,000 and photo-reduced to 1:20,000, which enabled us to use them directly to trace the shoreline onto the position and sounding overlays and to plot fixes. (All position information has been denoted on these four sheets in violet ink.)

The eastern shore of Valdez Arm was edited conventionally, using three-point sextant fix for control. Triangulation stations were used as objects for all these fixes (numbers 3 through 40). A somewhat different approach was taken on the western side. Mini-Ranger III by Motorola, a range-range electronic navigator, as well as sextant angles, were used for fixes 2001 to 2053. The mini-ranger navigator was mounted in an 18' Monarch aluminum skiff with an 85 horsepower outboard. The antenna was placed atop a ten foot 2X4 which was stayed-down to the corners of this square skiff, and two 12 volt car batteries were used for power. This skiff had draft of about 2.2 feet with the engine down and about 1.3 feet with the engine up, and this includes three people necessary for the operation. To take a fix with the mini-ranger gear, the skiff would be driven to the rock, bluff, low water line, or reef in question; and then when in position, a "hold display" button depressed on the navigator would "freeze" the two ranges so they could be copied by the recorder. At the time of the fix, sextant angles were also taken to various triangulation stations. The sextant angles were only meant to provide a solid check on the system and also as

further data with which accuracy of the mini-ranger could be examined (i.e., knowing the accuracy of the sextant fixes).

Plotting of all field edit data was initially done on the 1:20,000 scale boat sheet, position overlay. This was done because none of the T-sheets were large enough to plot all the triangulation, and also the position overlay already had the mini-ranger arcs drawn, as the mini-ranger was used entirely to control hydrography on this sheet. Once the positions (fixes) were plotted on the position overlay, they were then transferred to the appropriate shoreline manuscript. Next the field editor would go back to the smooth boat sheet and draw in the verified or compiled shoreline from these fixes plus sketches and field verification of shoreline features. No plotting or notes were made on the photographs.

Also, another item that was accomplished during the field editing was that all field notes in the form of fixes were "smoothed" out and logged on a homemade form. This was done so that notes would not become useless due to the fact that they could not be interpreted by someone other than the recorder. Also, this form would be an excellent start in plotting field edit positions with a computer-plotter. This form includes the time (all times are Zulu, 0° meridian), Julian Date, position number, a brief description of the feature, and the positional information, whether that be mini-ranger, sextant angles, or both. The data from this form could easily be digitized and, consequently, computer-plotted for quick verification.

3. ACCURACY

A complete analysis of the accuracy of the manuscript or the positional information was not undertaken at this time. Generally 3 to 5 meter discrepancies were found when comparing computed ranges with sextant angles - ranges obtained from the mini-ranger system. No attempt was made to compute differences between the simultaneous sextant cuts and mini-ranger fixes; however, the data for this is being inserted in this report for further development.

4. ADEQUACY OF COMPILATION

The manuscript appears to be adequate except, of course, in the area where no shoreline was available. Positions taken at high water and low water agree very well with those shown on the T-sheets. Again it is emphasized that a complete field edit job was not the intent, but simply a check of any overlooked rocks, ledges, and the delineation of the shoreline north of Sawmill Bay.

5. RECOMMENDATIONS

There are several recommendations I would like to suggest:

a. Complete shoreline manuscript of the area from Sawmill Bay north should be photogrammetrically compiled.

b. Make a computer plot of fixes; then compare these with the manuscript. I feel that my numbers are more accurate than the method in which they were plotted (i.e., with odeyssey and 3-arm protractors).

c. The paper Ozalids are very prone to destruction when inundated by water, namely rain. The Alaskan climate is very wet, plus the fact that field edit on the DAVIDSON in Alaska is entirely done from a skiff which is further susceptible to salt spray. This paper becomes impossible to work with when even the slightest bit wet. Is there a better surface?

d. As an aid in determining the accuracy of the mini-ranger for use in field edit applications, the given data could be analyzed.

REVIEW REPORT TP-00264
SHORELINE

61. GENERAL STATEMENT

Final review for this final Class III map was accomplished at the Atlantic Marine Center in September 1984. For a schedule of the office and field operations, refer to the Summary included in this Descriptive Report.

62. COMPARISON WITH REGISTERED TOPOGRAPHIC SURVEYS

Not applicable.

63. COMPARISON WITH MAPS OF OTHER AGENCIES

A comparison was made with the following U.S.G.S 1:63,360 scale quadrangles: Anchorage (A-1), Alaska, 1960; Valdez (A-8), Alaska, 1960; Cordova (D-8), Alaska, 1952; and Seward (D-1), 1952.

64. COMPARISON WITH CONTEMPORARY HYDROGRAPHIC SURVEYS

A comparison was made with registered copies of the following contemporary hydrographic surveys: H-9388, 1:20,000 scale, field surveyed August 1973; and H-9422, 1:20,000 scale, field surveyed in 1974.

Partial field edit was accomplished by the hydrographer to that area common to the hydrographic (navigable area) survey limits of H-9422. Field edit primarily consisted of locating alongshore and offshore rocks by hydrographic survey methods.

65. COMPARISON WITH NAUTICAL CHARTS

A comparison was made with the following NOS Charts: 16707, scale 1:40,000, 3rd edition, dated February 27, 1982; and 16708, scale 1:79,291, 16th edition, dated October 3, 1981.

66. ADEQUACY OF RESULTS AND FUTURE SURVEYS

This map complies with the Project Instructions, and meets the requirements for National Standards of Map Accuracy.
