SUMMARY TO ACCOMPANY
DESCRIPTIVE REPORT

TP-01166

This 1:20,000 scale shoreline map is one of the four maps in project CM-8203, Seymour Canal, Alaska.

The project encompasses the mouth of Seymour Canal, Latitude 57°30'30" north to its headspring, Latitude 58°06'00".

No field edit will be performed as per project instructions dated September 6, 1984.

Field work prior to compilation was accomplished in May 1983. It was comprised of both the identification of horizontal control and hydrographic signals by premarking techniques to meet aerotriangulation requirements.

Color and infrared photography was taken in July 1983 with the "B" camera (focal length 152.74 mm). The color photography (1:50,000 scale) was used for bridging and instrument compilation. The infrared photography (1:30,000 scale) was used to graphically compile the mean lower low water line.

Analytic aerotriangulation was completed at the Washington Science Center in May 1984.

Compilation was performed at the Atlantic Marine Center in August 1984 from office interpretation of the 1983 photography.

Final review was executed at the Atlantic Marine Center in September 1984. There will be no field edit on this map which requires it to be registered as a Final Class III map.

The original base map and all pertinent data were forwarded to the Washington Science Center for final registration.

Shoreline Mapping Report

Job CM-8203
Seymour Canal, Alaska

Shoreline mapping operations in Seymour Canal, Alaska (Job CM-8203) were undertaken concurrently with Special Project S-0902-DA-83. Four 1:50,000 scale aerotriangulation control panels were placed in the vicinity of Seymour Canal with a fifth panel located in Stephens Passage, north of Seymour Canal. Thirty-three 1:30,000 scale hydrographic control panels were placed in locations advantageous in controlling future hydrographic survey operations. The first panel was laid down on 28 April 1983 with operations concluding on 24 May.

1:50,000 Aerotriangulation Control

Three 1:50,000 Aerotriangulation Control Panels were placed within the limits shown on the sketch included with project instructions (sketch attached). The remaining two panel locations were placed as near as possible to the desired area, due to topographic constraints found within the proposed panel areas. Station SEYMOUR, 2 km north of the limits for Panel #4, and station WEED, 4.5 km West Northwest of the proposed limit for panel #3 were both paneled outside the limits shown in sketch included with the project instructions. Four stations within Seymour Canal were paneled to specifications of Array #1 as shown in Photogrammetric Instructions #22. The four stations were established and field geographic positions determined during the course of operations for S-0902-DA-83. Station GUNT was paneled direct, using only 2 rays, due to the small size of the island upon which it is located. A sub-station was established for station MOLE in Pleasant Bay, as the station is located in a rocky area near the treeline. A 2-ray variation of Array #1 was used. This subpointed location also serves as HP-01, a 1:30,000 hydrographic control site. Station WEED was paneled direct on a grass-covered peninsula, utilizing three rays. At station SEYMOUR, Reference Mark 1 was paneled direct with 2 rays. The fifth 1:50,000 scale panel was placed at station RAIN 1917. The station mark was recovered well inside of the treeline, so the reference mark was paneled direct using a 2-ray variation of Array #1 as shown. A recovery note was submitted as required for this station. Station descriptions were prepared and submitted for stations GUNT, MOLE, WEED, and SEYMOUR with the horizontal control data for S-0902-DA-83.

1:30,000 Hydrographic Control Panels

Hydrographic control panels were placed in thirty-three locations to supplement the established horizontal control network. The majority of these panels were set in small bays and passages where the terrain was suited to the placement of the panel

and the location was deemed advantageous as a control point for hydrography. Array #2 panel and spacing dimensions were followed as closely as possible, but in several cases, a 3-ray version was required. A copy of the large scale chart of the area is included with this report showing the locations of all hydrographic control panels as well as the aerotriangulation control panels. Hydrographic control panel locations were numbered from HP-01 through HP-39, with the exclusion of HP-23 through HP-28, which were used to designate similar panel locations in Kelp Bay (Job CM-8204).

Respectfully submitted,

Mark P. Koehn, LT, NOAA
Horizontal Control Officer

Approved and forwarded,

James M. Wintermyre, CDR, NOAA
Commanding Officer
NOAA Ship DAVIDSON

CM-8203
PHOTOGRAMMETRIC PLOT REPORT
SEYMOUR CANAL, ALASKA

MAY 1984

21. AREA COVERED

This project covers Seymour Canal, Alaska. The area is covered by four 1:20,000-scale sheets, TP-01163 to TP-01166.

22. METHOD

Three strips of 1:50,000-scale color photographs were bridged by analytical aerotriangulation methods using premarked control for shoreline mapping. Tie points were used to aid control and ensure a good adjustment between strips. Tie points were also dropped to four strips of 1:30,000-scale color photographs to be used as control to adjust these strips. The 1:30,000-scale color photographs were bridged by analytical aerotriangulation methods using the tie points from the 1:50,000-scale color photographs to provide positions for premarked hydrographic points. Of the 33 hydrographic points, 26 points were visible on the photographs and subsequent positions determined for these points. The original film was used for bridging the entire project. The photographs were adjusted using the Alaska, Zone 1 Coordinate System.

Ratio values were determined for the 1:50,000-scale bridging photographs and the 1:30,000-scale MLLW photographs. Base sheets were ruled on the Calcomp 718 plotter using the Alaska, Zone 1 Coordinate System.

23. ADEQUACY OF CONTROL

The control for this project was adequate for the job and within NOS accuracy standards. A copy of the fit to control is included in this report.

24. SUPPLEMENTAL DATA

USGS quadrangles were used to provide vertical control for strip adjustments.

25. PHOTOGRAPHY

The coverage, overlap, and quality of the 1983 B(C) photographs were adequate for the job.

COMPILATION REPORT
TP-01166

31 - DELINEATION

Delineation was accomplished using the Wild B-8 stereoplotting instrument and graphic compilation methods. Instrument compilation was used to delineate the shorleine, alongshore and interior detail based upon office interpretation of the 1:50,000 scale bridging/compilation color photographs. Predicted tide MLLW infrared ratio photographs were used to graphically compile the approximate mean lower low water line. Control for this graphic delineation was provided by the instrument compilation of coastal detail and common image points.

All photographs used to compile the map are listed on form 76-36B. The color compilation photography was adequate. The quality of the infrared photography was poor with regard to identifying precise image points common to the compilation photographs.

32 - CONTROL

The horizontal control was adequate. Refer to the Photogrammetric Plot Report dated May 1984.

33 - SUPPLEMENTAL DATA

None.

34 - CONTOURS AND DRAINAGE

Contours are not applicable to the project. Drainage was compiled by office interpretation of the photographs.

35 - SHORELINE AND ALONGSHORE DETAILS

The mean high water line was compiled by office interpretation of the compilation color photographs.

Although the scale of photography was 1:50,000, an attempt was made to distinguish between the ledge and rocky areas. Foreshore areas of scattered rocks were generally represented by individual rocks. The ledge symbol was used in areas of dense rock and where the ledge was apparent.

36 - OFFSHORE DETAILS

Offshore details was compiled by instrument methods as described in Item #31.

In order to graphically compile the approximate mean lower low water line as described in item #31, the MLLW infrared photographs were ratioed as follows:

83 B(I) 4712 - 4716	1.521 times
83 B(I) 4725 - 4732	1.511 times
83 B(I) 4779 - 4783	1.528 times
83 B(I) 4788 - 4792	1.526 times

37 - LANDMARKS AND AIDS

Appropriate copies of 76-40 forms are submitted with this report.

38 - CONTROL FOR FUTURE SURVEYS

None.

39 - JUNCTIONS

Refer to the Data Record Form 76-36B, Item 5 of the Descriptive Report.

40 - HORIZONTAL CONTROL

See item #32.

46 - COMPARISON WITH EXISTING MAPS

A comparison was made with the following U.S. Geological Survey Quadrangles: Sitka (C-1), Alaska, dated 1951, revised 1967, scale 1:63,360; and Sumdum (C-6), Alaska, dated 1951, revised 1972, scale 1:63,360.

47 - COMPARISON WITH NAUTICAL CHARTS

A comparison was made with the following NOS Charts: 17362, 8th edition, dated April 22, 1978, scale 1:40,000; and 17360, 25th edition, dated January 29, 1983, scale 1:217,828.

ITEMS TO BE APPLIED TO NAUTICAL CHARTS IMMEDIATELY

None.

ITEMS TO BE CARRIED FORWARD

None.

REVIEW REPORT TP-01166
SHORELINE

61. GENERAL STATEMENT

See Summary included with this report.

The infrared photography was of sufficiently good quality that adequate photo points were found and the mean lower low water line was compiled graphically. The classification of some of the foreshore areas was changed in Final Review.

The hydro control panels which were field identified were not used in office compilation. The identification of these points on the 1:50,000 scale compilation photographs was not possible. However, they were readily identifiable on the 1:30,000 scale color photographs which were not supplied for compilation..

The point data set derived by the bridging section for the hydro signals is for the hydrographer's aid only and was not necessary for compilation of the maps.

62. COMPARISON WITH REGISTERED TOPOGRAPHIC SURVEYS

Not applicable.

63. COMPARISON WITH MAPS OF OTHER AGENCIES

A comparison was made with U.S.G.S. Quadrangles: Sitka (C-1), Alaska, dated 1951, minor revisions 1967; and Sumdum (C-6), Alaska, dated 1951, minor revisions 1972. Both are 1:63,360 scale.

64. COMPARISON WITH CONTEMPORARY HYDROGRAPHIC SURVEYS

There is no contemporary hydrographic survey within the limits of this map.

65. COMPARISON WITH NAUTICAL CHARTS

A comparison was made with NOS Charts: 17362, 8th edition, dated April 22, 1978, scale 1:40,000; 17360, 25th edition, dated January 29, 1983, scale 1:217,828; and 17320, 11th edition, dated October 1, 1983, scale 1:217,828.

66. ADEQUACY OF RESULTS AND FUTURE SURVEYS

This map complies with the Project Instructions and meets the requirements for National Standards of Map Accuracy.

OFFICE

I. OFFICE IDENTIFIED AND LOCATED OBJECTS
Enter the number and date (including month, day, and year) of the photograph used to identify and locate the object.
EXAMPLE: 75E(C)6042
8-12-75

FIELD

I. NEW POSITION DETERMINED OR VERIFIED
Enter the applicable data by symbols as follows:

F - Field	P - Photogrammetric
L - Located	Vis - Visually
V - Verified	
1 - Triangulation	5 - Field identified
2 - Traverse	6 - Theodolite
3 - Intersection	7 - Planetable
4 - Resection	8 - Sextant

A. Field positions* require entry of method of location and date of field work.
EXAMPLE: F-2-6-L
8-12-75

*FIELD POSITIONS are determined by field observations based entirely upon ground survey methods.

FIELD (Cont'd)

B. Photogrammetric field positions** require entry of method of location or verification, date of field work and number of the photograph used to locate or identify the object.
EXAMPLE: P-8-V
8-12-75
74L(C)2982

II. TRIANGULATION STATION RECOVERED
When a landmark or aid which is also a triangulation station is recovered, enter 'Triang. Rec.' with date of recovery.
EXAMPLE: Triang. Rec.
8-12-75

III. POSITION VERIFIED VISUALLY ON PHOTOGRAPH
Enter 'V-Vis.' and date.
EXAMPLE: V-Vis.
8-12-75

**PHOTOGRAMMETRIC FIELD POSITIONS are dependent entirely, or in part, upon control established by photogrammetric methods.

SUPERSEDES NOAA FORM 76-40 (2-71) WHICH IS OBSOLETE, AND EXISTING STOCK SHOULD BE DESTROYED UPON RECEIPT OF REVISION.
