Summary to Accompany Descriptive Report
T-12162 thru 12165 and T-11711 thru 11713

T-12162 thru 12165 at 1:5,000 scale, and T-11711 thru T-11713 at 1:10,000 scale comprises the northern portion of Project PH-5909 and covers Culebra Island and the off-lying islands, Puerto Rico. The purpose of this project was to provide photo-hydro support. Refer to the project diagram for the location of each sheet in the project.

The only field work preceding compilation was the premarking and identification of control necessary for bridging. See Photogrammetric Plot Report for details.

Compilation was accomplished from December 1966 thru February 1967 using the B-8 plotter. Stable base copies and ratio prints were furnished for hydro support and field edit. Neither hydro or field edit was accomplished.

See Instructions-Office-, dated November 10, 1975, page 6 of this report for completion requirements.
TO: Chief, Photogrammetric Branch
FROM: James Collins, Chief, Coastal Mapping Division

SUBJECT: Instructions-OFFICE, Job Completion-Job PH-5909, Culebra, Vieques, and Adjoining Islands, Puerto Rico

1. Background

The 3 job maps covering Vieques Island were field edited, reviewed, and registered. The remaining 7 maps in the project, covering Culebra and adjacent islands, are in the Class III stage of completion. These maps were compiled from photographs taken in 1964 and 1965.

Inshore hydrography requiring photo-hydro support data will not be done prior to 1981.

2. Job Completion Requirements and Procedures

.01 The 7 Class III maps shall be final reviewed, registered, and other job completion operations performed in accordance with standard procedures.

.02 Field edit operations for these first editions of the Class III maps are cancelled. Any future work involving these maps, in either revision with new photography or new basis mapping, will be done under a new project. Any maps produced at the same scale and having common coverage will be second editions.

.03 Photo-hydro support data stored in the Riverdale files shall be destroyed.
PHOTOGRAMMETRIC PLOT REPORT
Job PH-5909
Culebra Island, Puerto Rico

21. Area Covered

This report covers Culebra Island, Puerto Rico, and consists of the following 1:5,000 scale T-sheets: T-12162, T-12163, T-12164, T-12165; and 1:10,000 scale T-sheets as follows: T-11711, T-11712, T-11713 and T-11714.

22. Method

Analytic aerotriangulation methods were used to bridge a single strip using "S" camera, color photography at 1:40,000 scale. The attached sketch of the strip bridged shows the placement of triangulation furnished and those that were used in the final strip adjustment. Closures to control have been tabulated. State plane coordinates (Puerto Rico) have been furnished for all bridge points on the IBM readout.

In order to facilitate compilation of 1:5,000 scale manuscripts from 1:15,000 scale photographs, a separate short bridge was run using 1:40,000 scale color photographs 66-S-2409 thru 2412. Common points were drilled on both the color and 1:15,000 scale panchromatic plates. These points will be used to scale the 1:15,000 scale models.

Passpoints used were the same on both bridges and the position error between bridges averages less than one (1) foot.

23. Adequacy of Control

All horizontal control was premarked with white panels except for substation LOBITO EAST which was identified on 1959 photography. Nevertheless, control was very adequate. CULEBRITA ISLAND LIGHT 1900 was not field identified. However, an attempt was made to office identify the station but would not hold in the bridge. Vertical control needed for the adjustment was selected on the shoreline.

25. Photography

Although photography was not free from cloud cover, it was satisfactory for bridging purposes. Tie points for two additional models (66-S-2335-36 and 66-S-2346-48) were furnished.
One was needed to compile an area not covered on the bridge strip.

Respectfully submitted:

I. I. Saperstein

Compilation Report
Project PH-5909
T-11711 thru T-11713
and
T-12162 thru T-12165
February 1967

This report covers the shoreline compilation of T-11711 thru T-11713 at a
scale of 1:10,000, and T-12162 thru T-12165, 1:5,000 scale. T-11714
(1:10,000) was discontinued as the land area was covered by 1:5,000 scale
compilation (see project layout sketch). These manuscripts were compiled
to furnish a base for photo-hydro support. The area covered includes
the shoreline of Culebra Island in its entirety and surrounding islands.

31. Delineation

The manuscripts were delineated on the Wild B-8 stereoplotter. The 1:5,000
scale manuscripts were compiled from 1964, 1:15,000 scale panchromatic
photography. Those 1:5,000 scale maps, where applicable, were reduced
for transfer to the 1:10,000 sheets. The 1:10,000 scale manuscripts were
delineated from 1966, 1:40,000 scale color photography. Points were
dropped along the shoreline to facilitate hydrographic signal location.
Cronapaque ratio prints of the 1964 and 1966 photography were resected to
the manuscripts and prepared in the usual manner for photo-hydro support.
The 4X ratio of the color photography was printed in black-and-white.

Several areas along the shoreline appeared to be overgrown with mangrove
and foliage. These were shown with an apparent shoreline and labeled
"swamp".

32. Control

Bridge points furnished by aerotriangulation were sufficient to adequately
compile the shoreline and to locate pass points for photo-hydro support.

33. Supplemental Data - None

34. Contours and Drainage - Inapplicable

35. Shoreline and Alongshore Details

The character of the shoreline in this area consists of much foreshore
coral reef. This was carefully delineated along with rocks, shallow, and
shoal areas.

36. Offshore Details

Throughout the project, an approximate underwater ledge line was shown
as an aid to the hydrographer.
37. **Landmarks and Aids**

Visible aids were located photogrammetrically and form 567 was submitted to the field editor.

38. **Control for Future Surveys** - None

39. **Junctions**

A satisfactory junction was made with adjoining sheets (see project layout sketch).

40. **Horizontal and Vertical Accuracy**

See bridging report

41. thru 45. Inapplicable

46. **Comparison with Existing Maps**

None made.

47. **Comparison with Nautical Charts**

C&GS charts 913, 914, and 915.

These charts appear to have local errors in the horizontal datum.

61. General Statement: Due to the extreme difficulty in obtaining control for this area and lack of basic shoreline data, this portion of the project that was not field edited or used for hydrography was not cancelled but will be registered as Class III maps.

The nature of the shoreline (mostly high bluffs) is such that a good MHWL could be compiled from office interpretation of photography and little or no change would be expected from a field edit. The exception to this would be the small islets and rocks shown as bare. Some of these could be awash at MHW.

The ledge line should not be used as the MLWL. The area covered by the ledge symbol includes areas that would be completely submerged at MLW. The approximate underwater ledge limits (a bottom characteristic) was drawn only as an aid to the hydrographer, to indicate possible small boat landing sites, and covers depths to 20-25 feet.

62. Comparison with Registered Topographic Surveys: None available.

63. Comparison with Maps of Other Agencies: U.S.G.S. scale 1:30,000, 1950 edition, Culebra and Adjacent Islands, Puerto Rico, no significant differences noted.

64. Comparison with Contemporary Hydrographic Surveys: None available.

65. Comparison with Nautical Charts: USC&GS Charts 913 scale 1:6,500, 914 scale 1:20,000, and 915 scale 1:10,000.

There are isolated datum differences throughout these charts. This could be the result of inadequate control on the original surveys of 1900.

66. Adequacy of Results and Future Surveys: These maps comply with the project instructions and meet the National Standards of Map Accuracy except as qualified in Item 61, General Statement.
