SUMMARY TO ACCOMPANY

DESCRIPTIVE REPORT T-11962

Shoreline survey T-11962 is one of twenty-five similar surveys in Project PH-6201. These surveys cover the entire coast of Molokai. This survey covers that part of the south coast extending from Ualope to the vicinity of Kamalo. See page 5 for the area within the project.

Field work preceded compilation. This consists of recovery and identification of horizontal control, shoreline and field inspection and the selection of landmarks for charts.

Compilation was at 1:5,000 scale by Kelsh Instrument methods using the photography of October 1960 and September 1961. Cronaflex copies of the compilation manuscript along with ozalids and specially prepared photographs were subsequently furnished for transfer of the shoreline to the boat sheet, field edit use and for photography support.

There is no field edit report or sheet for this survey. It was evidently field edited in conjunction with hydrography in the area and no discrepancies noted.

The compilation manuscript was a vinylite sheet 2 minutes in latitude by 2 minutes 30 seconds in longitude which was scribed and reproduced on cronaflex. Final review was in the Atlantic Marine Center in January 1971. One cronaflex positive and a negative of the final reviewed survey are forwarded for record and registry.
FIELD INSPECTION REPORT

Project FH-6001

January - October 1962

2. AREAL FIELD INSPECTION

The area covered by this report encompasses the whole of the island of Molokai. This is the fifth largest of the group of islands that form the State of Hawaii. The island was originally formed by the eruption of two volcanoes. One was located somewhere near the east end of the island and the other somewhere near the west end. Following these eruptions the numerous deep drainages were created by stream erosion and the ocean created the great cliffs along the north coast. A later eruption formed the Nakalele Peninsula on the north central coast. The Kauliko Crater remains as evidence of this eruption. The highest peak is Kauakou which is 4958 feet above sea level.

The climate of the island varies considerably depending on the elevation and location in relation to the prevailing trade winds. The mean annual temperature at sea level is about 74 degrees. The temperature seldom varies more than 10 degrees except at the higher elevations. The yearly rainfall varies from about 7 inches around Kaunakakai to over 150 inches in the high mountain sections of the northeast.

The only port in use on the island is located at Kaunakakai. A small wharf connected to the shore by a long mole is used to load and unload barges, and serve small commercial and private boats. At one time a railroad connected the wharf to the area now known as Hoolehua Homesteads. It was abandoned soon after completion as the sugar plantation it was constructed to serve was a failure. The economy of the island is almost wholly dependent on the growing of pineapple and cattle ranching.

The wharf located at Kolo was used for a time to load pineapple from the Kaunaloa area. It was later abandoned and since that time has been partially destroyed by fire. The wharf located at Waiolo is now in poor condition and seldom used except by an occasional small fishing or pleasure boat. The wharf located at Puloe is no longer in evidence. Located at Haledon is a small harbor protected by a breakwater. This is a private harbor and is used to load sand and cinder barges for shipment to Oahu. A small private airstrip is located along the easterly breakwater.
Located on the Hakalau Peninsula is the small settlement of Kalau-papa. The settlement is maintained by the State of Hawaii, Department of Health for the treatment of Hansen's Disease (Leprosy). Special permission must be obtained from the state before visiting this area. No facilities for serving the public are permitted on the peninsula. The U.S. Coast Guard maintains an isolated light station at the northern tip of the peninsula. The area is served by limited airplane service and supplies are brought in by barge at infrequent intervals. A small wharf protected by a short breakwater is located at the settlement. This area is isolated from the remainder of the island except for a foot trail that leads down the steep rocky cliffs from the top of the pali southwest of the settlement.

Shoreline around the island vary from the almost vertical rock cliffs along most of the north and east coast, to the narrow and relatively flat coastal areas along the south coast. Most of the south coast is protected by an offshore reef. A few sandy beaches are located along the south and west coasts. Most of the north coast is accessible only by boat and any landings there should be attempted with extreme caution.

Photography was adequate for the identification of horizontal control and shoreline inspection for most of the island. A few sections of the shoreline along the northeast coast of the island were in complete shadow from the most vertical cliffs.

The shoreline for the entire island was visually inspected on the mean high water noted on the field photographs. The shoreline along the north coast except for the Hakalau Peninsula was inspected by cruising offshore in a small boat. The work was difficult due to the small size of the boat, the rough seas, and strong winds. A few landings were made on the more prominent points along the northeast coast. The remainder of the island was inspected by walking the shoreline in the more accessible areas, and by observations from vantage points along bluffs and cliffs where the shoreline could not be otherwise visited. Scattered sections of the shoreline along the south coast were obscured by overhanging kane trees and dense growths of mangrove trees.

3. HORIZONTAL CONTROL

(a) The following described intersection stations were located by traverse or triangulation as nautical aids, aeronautical aids, and landmarks.

Kolokai Lighthouse
Kolokai Airport Beacon
Hainuwa, Aero Beacon Red Light
Haulapuu, Aero Beacon Red Light
Kolohai VOR (MKN)
Puu Aapalu, Tank
Ilio Pt., Coast Guard Loran Mast
Waichewahe, Aero Beacon Red Light
Lau Pt. Light
Kaunakakai Harbor, Entrance Range, Front Light
Kaunakakai Harbor, Entrance Range, Rear Light

(b) No datum adjustments were made by the field party.

c) WAILEI 2, 1945 was the only control station identified that was not established by the Coast and Geodetic Survey. This station was established by the Territory of Hawaii and can be considered as third order accuracy. The station was destroyed before it could be tied to the 1962 work. HAWAII, 1962 which is located about a half mile west of this station was later identified. All other control stations identified were established by the Coast and Geodetic Survey or tied to by the geodetic party during the 1962 season. Many of the old stations could not be recovered and new stations had to be established to meet the control requirements.

d) Control stations were positively identified in all areas indicated on the control diagram.

e) All control stations within the limits of the project except for a few along the inaccessible northeast coast of the island were searched for. Part of this recovery was performed by the geodetic party located on the island. All stations searched for were listed on Form 526 which was submitted to the Honolulu District Officer. A complete list of all stations reported lost on Form 526 would have to be obtained from the Honolulu District Officer or the Division of Geodey. No stations that were listed as lost were identified for use in the plot.

(g) The quality of identification of each station or substitute station has been indicated on the control station identification card. None of the identification was considered to be sub-standard.

4. VERTICAL CONTROL

The only vertical control requirement was the recovery of all tidal bench marks in the project area and identification of one mark in each of the groups.

All tidal bench marks listed at Fukoo, Kamalo, Kaunakakai, and Kolo were searched for. A total of 18 bench marks were searched for. All marks were listed on Form 685 which was submitted to the Honolulu District Officer.
A total of 13 U. S. Geological Survey bench marks were searched for. These marks were used in conjunction with the tellurometer traverse work on the island and for use in determining the elevation of landmarks. All marks were listed on Form 685 which was submitted to the Honolulu District Officer.

5. CONTOURS AND DRAINAGE

Contours not applicable

Drainage is self evident on the photographs. All streams except for a few in the larger valleys of the northeast coast and near the east end of the south coast are intermittent. During the wet season there are dozens of waterfalls cascading from the tops of the cliffs and rims of the valleys of the northeast coast. Marsh areas have been indicated on the field photographs.

6. WOODLAND COVER

The mountainous areas of the northeast part of the island is covered with a dense growth of native ferns and hardwoods. A large stand of planted softwoods is located along the top of the pali in the north central part of the island. Koa trees which were introduced to the island about 100 years ago cover most of the remainder of the island except for the cultivated areas. Along the mud flats of the south coast there are scattered stands of introduced Mangrove trees.

7. SHORELINE AND ALONGSHORE FEATURES

(a) The mean high water line was indicated on the photographs. Along some sections of the northeast coast the shoreline was obscured due to the shadows created on the photographs from the almost vertical cliffs. In some areas of the south coast the shoreline was partially obscured by low overhanging Koa trees. In most cases this overhang was less than 10 meters and the approximate correct location was indicated on the photographs. Also along the south coast there are scattered stands of Mangrove trees. In these areas the mean high water line was indicated as apparent shoreline.

The shoreline along the north, east, and small areas of the west and southwest coast contain many areas of alongshore rocks, projecting reefs and ledges, and almost vertical bluffs. These features combined with a normally heavy surf breaking along the shore tend to confuse the location of the mean high water line on the photographs.

Where possible especially along the beach areas and the more accessible sections of the coast the location of the mean high water line was determined by measurements to near by objects.
(b) The low water line was not indicated on the photographs.

(c) Where possible the character of the foreshore was indicated on the photographs.

(d) The north, east, and sections of the west and southwest coast is bordered by rocky cliffs. In some cases these cliffs are over 2000 feet high. Along most of the south coast, sections of the west coast, and the Hoomoli area the land has a more gradual slope with a small relatively flat area adjacent to the coast.

(e) The only unnatural features to be found in the project area were located at Kalaupapa, Kemalo, Kaunakakai, Kolo, and Haleolono. All information regarding these features was indicated on the field photographs.

(f) Not applicable

(g) Along the south shore there are the remains of many fishponds. The stone walls for some of these have been completely leveled and for most of the others large sections of the walls have been leveled. The location of these fishponds is apparent on the photographs.

8. OFFSHORE FEATURES

Offshore rocks are located along many areas of the north, east, and sections of the west and southwest coast. Most of these rocks that are visible on the photographs are adjacent to the shore. In these areas it is probable that there are many rocks that are not visible on the photographs but are close enough to the surface of the water to consider the foreshore as being foul with submerged rocks. The height of many of the rocks along the shore were estimated at the time the shoreline was inspected.

A reef about 0.5 to 1.0 mile offshore is located along most of the south coast. Between the reef and the shore there are scattered areas of sand and many coral heads that project at low water.

9. LANDMARKS AND AIDS

(a) All charted landmarks were investigated by the field party. A total of 13 old landmarks were deleted from the charts and four old landmarks were retained. A total of 11 new landmarks were selected for charting. The old landmarks which were to be deleted were indicated on the sections of the charts on which they appeared. These sections of the charts will be submitted with the field records. All old landmarks that were retained and the new landmarks selected for charting were listed on Form 567, and the elevation for each landmark was determined by the field party.

(b) No interior landmarks were selected for charting.
(c) The geographic positions for the following charted aeronautical aids were determined by traverse or triangulation during the 1962 field season.

- Molokai, Airport Beacon
- Waiahehiaha, Aero Beacon Red Light
- Waikanaa, Aero Beacon, Red Light
- Kuilapuu, Aero Beacon, Red Light

The geographic position of one new aeronautical aid selected for charting was determined during the 1962 field season.

- Molokai VOR (1030)

All aeronautical aids to be charted were listed on Form 567 and the elevation for each aid was determined by the field party.

(d) The geographic positions of the following list of aids to navigation were determined by the field party during the 1962 season.

- Molokai Lighthouse
- Laau P. Light
- Ilio Pt., Coast Guard Loran Mast
- Kawahakai Harbor, Entrance Range, Front Light
- Kaunakahai Harbor, Entrance Range, Rear Light

All nautical aids to be charted were listed on Form 567 and the elevation for each aid was determined by the field party.

(e) Not applicable

10. BOUNDARIES, LIMITS, AND LINES

Not applicable

11. OTHER CONTROL

No recoverable topographic stations were established.

In all areas where identifiable objects could be found photo hydro sites were selected. In some cases it will be necessary to locate a more suitable location for the hydrographic signals from the selected photo hydro sites.

12. OTHER INTERNAL FEATURES

All roads in the project area were classified on the field photographs in compliance with the project instructions.
All public buildings with their function was indicated on the field photographs.

The main airport serving the island is located south of the Hoolahua Homestead area in the central section of the island. A small airport for use by small aircraft is located on the Makalula Peninsula. A small private airstrip is located at Haleolono near the southwest end of the island.

No bridges or overhead cable crossings over navigable water are located in the project area. There are no submerged cables connecting the island with other areas.

13. GEOGRAPHIC NAMES

Not Applicable

OCT 30 1962
Aerotriangulation Report
MOLOKAI Island, Hawaii
Project PH-5201
July 1962

Aera Covered

This report discusses the results of aerotriangulation of three strips of photographs on the southeast portion of Molokai Island. It covers shoreline surveys T-11928 (in part) at 1:10,000 scale, T-11953 (in part) at 1:10,000 scale, T-11959 at 1:5000 scale, T-11960 at 1:10,000 scale, T-11961 thru T-11964 at 1:5000 scale and T-11965 at 1:10,000 scale. Other parts of this project will be covered by subsequent reports.

Method

The three strips were done by stereoplaneigraph and furnish sufficient pass points for compilation of shoreline details by Kelsh instruments. Strip #3 coordinates were computed by a linear transformation using the Clary Computer. Strip #1 and #2 were computed by the IBM-650 Computer. Although two stations did not hold in the adjustment for Strip #2 (See Item 23 below), the adjustment for all strips is believed to be satisfactory for the required accuracy of these surveys. This is based on the closures to other stations and the ties between strips. (See appended sketch)

23. Adequacy of Control

With exceptions below, control was adequate and complied with project instructions.

Advance field positions for Stations HALEAHI, 1962 and RAYKAMI, 1962 were used. Both indicated a similar error in X-coordinates. Inconsistencies were detected in directions furnished by the field party which could account for these discrepancies. Positions affected in Strip #2 should be verified after the receipt of final positions.

24. Supplemental Data

None.

25. Photography

Adequate for aerotriangulation.

31. **DETERMINATION**
   Stereoscopic instrument (Kelsh Plotter) methods were used for compilation with photography taken in 1951. Interior details are incomplete.

32. **CONTROL**
   The identification, density and placement of horizontal control was adequate.

33. **SUPPLEMENTAL DATA**
   None

34. **CONTOURS AND DRAINAGE**
   Contours - Inapplicable
   Drainage was delineated by stereoscopic methods.

35. **SHORELINE AND ALONGSHORE DETAILS**
   Shoreline inspection was adequate. The highwater line was delineated using the reference distances from prominent objects where they were recorded on the field inspection photographs.
   The low water line (where shown) was delineated from office interpretation of the photographs.

36. **OFFSHORE DETAILS**
   Offshore details (reef lines, etc.) were delineated from office interpretation of the photographs. The color photography was used as an aid for compiling the offshore details.

37. **LANDMARKS AND AIDS**
   Landmarks and aids for surveys T-11850 thru T-11865 are reported on Forms 557. Copies of these forms are a part of this report.

38. **CONTROL FOR FUTURE SURVEYS**
   There are no recoverable topographic stations on this group of surveys.
   An incomplete copy of these surveys showing the shoreline and offshore details along with a set of ratio photographs with pass points and field identified photo-hydro signals was prepared and submitted for the use of the hydrographic party.
39. JUNCTIONS

   Junctions for surveys T-11269 thru T-11365 are in agreement.

40. HORIZONTAL AND VERTICAL ACCURACY

   See Item 23 of the Aerotriangulation Report bound with this report.

46. COMPARISON WITH EXISTING MAPS

   Comparison was made with the following U.S.G.S. Quadrangles:

   Kamalo, Hawaii  1:24,000 Scale  1952

   Halawa, Hawaii

   Kaunakai, Hawaii

47. COMPARISON WITH NAUTICAL CHARTS

   Chart No. 4120  1:50,000  3rd Ed. 1936  Revised 6/2/58
   Chart No. 4121  1:50,000  1st Ed. 1928  Revised 9/17/57
   Chart No. 4121  1:50,000  1st Ed. 1928  Revised 9/17/57

   Items to be applied to Nautical Charts immediately: None

   Items to be carried forward: None

Respectfully submitted,
22 January 1964

**Field Completion Additions and Corrections to the Manuscript**

42. Additions and corrections furnished by the field completion survey have been applied to the manuscript. The manuscript is now complete except as noted under item 43.

C. C. Harris

**Supervisor**

Leo F. Beuget

43. Remarks
61. **GENERAL STATEMENT:**

See Summary, which is page 6 of the Descriptive Report.

62. **COMPARISON WITH REGISTERED TOPOGRAPHIC SURVEYS:**

Comparison was made with a copy of registered survey No. 4113, 1:5,000 scale, dated January, 1925. The shoreline of the two surveys is not in good agreement, that of survey No. 4113 is north of that delineated on T-11962. Survey No. 4113 is superseded by T-11962 for nautical chart construction purposes.

63. **COMPARISON WITH MAPS OF OTHER AGENCIES:**

Comparison was made with U.S.G.S. XAMALO, HAWAII, 7.5 by 8.5 minute quadrangle, 1:24,000 scale, edition of 1952. The two surveys are in good general agreement, no conflicts were noted.

64. **COMPARISON WITH CONTEMPORARY HYDROGRAPHIC SURVEYS:**

There were no contemporary hydrographic surveys available for comparison purposes at the time of final review.

65. **COMPARISON WITH NAUTICAL CHARTS:**

Comparison was made with chart 4130 6th edition, February 10, 1969. The following were noted:

The fixed aid to navigation at Kalaioa Harbor is not visible on the photographs nor is it listed in the 1970 Light List, Vol. III, Pacific Coast and Pacific Islands.
A rock awash located at latitude 21°02.6' longitude 156°51.2' is not visible on photographs of the area.

66. ADEQUACY OF RESULTS AND FUTURE SURVEYS:

This survey complies with instructions and meets the National Standards of Map Accuracy.

Chief, Photogrammetry Division
I recommend that the following objects which have been inspected from seaward to determine their value as landmarks be charted on the charts indicated.

The positions given have been checked after listing by... Donald J. Braut.

Miller J. Tonkel

Chief of Party

This form shall be prepared in accordance with Hydrographic Manual, pages 800 to 804. Positions of charted landmarks and nonfloating aids to navigation, if redetermined, shall be reported on this form. Revisions shall show both the old and new positions. The data should be considered for the charts of the area and not by individual field survey sheets. Information under each column heading should be given.
