The control of this sheet is based on a scheme of triangulation expanded from the base "Scallop Pt. - Clam Pt." lying across the valley of the Santa Ana River. These old stations were recovered with considerable difficulty, after extensive digging and grading with teams and scrapers.

The triangulation was extended westward as far as the Pavilion at Anaheim Creek, and the corrections along the shore line connected to points trigonometrically determined.

The pleasure pier at Bay City was located on revised chart No. 5143 by triangulation from the westward but on sheet No. 1345 submitted herewith it has been independently located by the new triangulation.

There is but little change in the shore line at the mouth of Anaheim Creek. The spit at the eastern point of the entrance has moved inshore slightly but is probably subject to frequent small changes.

There is a pleasure pier and about 30 residences at Sunset Beach.

The inlet at Bolsas Creek has been closed for some years, and the creek is now connected by a canal with Anaheim Creek. A dam has been built by the Bolsa Chica Sun Club at the point of the bluff as shown. This dam has an automatic gate permitting an outflow from the marsh above it but closing against an inflow from below. The result of this action is that the area above the dam is now practically a fresh water marsh being fed by drainage from the peat land above.

There is a conspicuous high red water tank on the county road about 1/2 mile inshore as shown.

The high water mark throughout this sheet has been corrected by
Season and
Descriptive Report of
Chart Revision work in Southern California
To accompany Sheets (original topographic)
1 to 10 inclusive.
Season Jan 31 - May 31, 1914.

Limits and General Remarks.

The ground covered by this season's work extends from a point just north of Newport Bay, where Assistant Rhodes left off in 1910, to (but not including) the town of La Jolla. The revision work covers the territory within the limits shown on the original topographic sheets. The work of re-covering and re-marking the old triangulation stations (A. J. Rodgers 1884-86, 1887 and A. W. Chace 1874-75) consumed more time and effort than did the topographic work. Relatively speaking, the area contained in this work, as not at present of very great importance from a mariner's standpoint, as vessels plying the coast set a straight course from San Pedro Channel to clear Pt Loma (or vice versa), thus passing the greater part of this coast too far out to see ordinary objects.

Prominent Objects.

For future use, and for vessels passing closer inshore, a number of prominent objects, such as.
conspicuous ware houses, water tanks, barns, school houses, etc., were determined by sextant angles taken at the triangulation stations and plotted on the sheets. There were no light houses or beacons on this coast.

Towns and Villages.

Generally speaking, the towns in Southern California, have remained quite inactive since the original topography was done. Oceanside, San Juan Capistrano, Encinitas, Leucadia (now called Carl) and Del Mar have shown very little advance, while many of the smaller places have almost become depopulated. Laguna (and additions) has grown some, and a small village called Cardiff between Encinitas and Del Mar, is being promoted. San Juan, Mateo, San Onofre, Las Flores, Sosa, La Costa, and Mille should not be shown as villages on chart 5100, for there are practically no inhabited houses at any of these places and they are merely crossroad flagging stations for local trains. Oceanside should be given the most prominence on the chart, and Laguna, Encinitas, San Juan Capistrano, Del Mar, Cardiff and Carl, are all about on a par. There are many realty promoters in Southern California, but not enough people to utilize all of the
out divisions. Much of the typography shown on
the original sheets was omitted from the copy of
chart 5100 in my possession.

Roads.

A number of new roads, near the coast, were
surveyed and many roads and buildings were
removed from the chart. Some of the old roads,
running back from the coast, were scarcely
ever used, but they were left on the chart under
possibility of a revival of their usage. The new
coast state highway is the most important road
which traverses this territory. This new highway
is being converted and, at the present time, the
portion between La Jolla and Oceanside and
from South Oceanside to Del Mar has been
completed. It is very much traveled and on
this account most of the other roads parallel
to the coast are falling into disuse. The
Coast roads in San Diego county are in much
better condition than in Orange County.

Change of Coast line.

With only one exception, there was not
evidence of sufficient change in the shore line to
affect the accuracy of the published charts. The
old triangulation stations, along the coast, which
were recovered, gave excellent evidence of this, and from these old stations the shore line was tested by angles and tangent. The beach at the mouth of San Juan River was the only change of any note.

The general method followed in doing the work, was to recover the triangulation stations first and from these take distant angles to prominent objects. Roads, etc., were often run in by compass and distance obtained by counting the revolutions of the wagon wheels. Local maps were obtained, whenever practicable, for correction of roads, streets, etc.,

Recovery of Old Triangulation Stations.

A total of 72 old triangulation stations were recovered, and, out of this number 36 were re-marked with standard station and reference marks set in concrete piers. There were no considerable stretches where none of the old triangulation stations could be recovered, therefore it was not deemed necessary to establish new ones. The old stubs were usually decayed and were often missing, but in some cases they were in fairly good preservation, depending on the kind of
oil they were in. Strange to say, one of the old signals (a tree) was still standing in its original position, and was so rotten it offered very little resistance, but toppled over, when pushed, and broke in numerous pieces as it fell to the ground.
