DESCRIPTIVE REPORT

Topographic Hydrographic

Sheet No. T5065 5065

LOCALITY

South Shore of Great Peconic Bay
Great Peconic Bay between Goose Creek and Cold Spring Pond
(and Robins Island)

1933

CHIEF OF PARTY

Roswell C. Bolstad, Jr., N. A. G. E.
Applied to drawing of chart 1214

11/21/34

Applied to new chart 363 - 12/22/41 E.E.T.
TOPOGRAPHIC TITLE SHEET

The Topographic Sheet should be accompanied by this form, filled in as completely as possible, when the sheet is forwarded to the Office.

Field No. 15

REGISTER NO. T6065 5065

State. New York

General locality. South Shore of Great Peconic Bay

Locality. Great Peconic Bay between Goose Cr. and Cold Spring Pond (with Robins Island)

Scale 1:10,000 Date of survey April 21, 1933

Date of Compilation Dec. 19, 1933

Wassuk Air-photo Compilation Party No. 12

Reviewed and recommended for approval

Surveyed by. (See data sheet enclosed in Descriptive Report for this sheet)

Inked by. P. A. Kelly

Heights in feet above to ground to tops of trees

Contour, Approximate contour, Form line interval feet

Instructions dated November 15, 1932

Remarks. Actual scale of celluloid sheet is 1:10,672. Compilation of five lens aerial photographs Nos. 601-605 (611-14).

Final sheet to be enlarged to 1:10,000 scale and printed by photolithographic process.

1874 - 1932
GENERAL INFORMATION.

The AIR PHOTO FIELD INSPECTION REPORT, 1933 of Lieut. L. C. Wilder for Eastern Long Island, L. I., furnished the necessary field data for the compilation of this sheet. Additional information was obtained from the field prints and, in questionable areas, from Lieut. R. C. Bolstad who is familiar with the topography of this area.

The accompanying NOTES ON COMPIILATION details all data in connection with the compilation of this sheet.

At the time that these photographs were taken (April 21, 1933 at 11:10 A.M.) the tide, at South Jamesport, was one and three quarters feet above mean Low Water as obtained from predicted tide tables.

This sheet was compiled from photographs taken by 2nd Lieut. James F. Olive, Jr. of the U. S. Army Air Corps with their five lens camera, model T-5A, No. 31-78, photograph numbers MS1 (881-14) to MS1 (881-14), inclusive.

CONTROL.

(A) Sources.

The following sources of control were used in the compilation of the sheet:

(a) Triangulation by Lieut. A. P. Ratti in 1933, unadjusted.

(b) Triangulation by Lieut. L. C. Wilder in 1933, unadjusted.

(c) 1933 Aluminum Control Sheet, (Lieut. A. P. Ratti) Reg. No. 4765

(d) 1933 Aluminum Control Sheet, (Lieut. L. C. Wilder's field sheets "A" and "B"") Reg. Nos.

The field party's geographic positions, unadjusted, were used; these are on the North American 1927 Datum.

Triangulation and topography (1:20,000 scale aluminum control sheet, showing high water line and control signals) executed by the party of Lieut. A. P. Ratti in 1933, forms part of the basis of control for this area; the remainder was executed by the party of Lieut. L. C. Wilder, in 1933. It should be noted that the topography executed by Lieut. L. C. Wilder (1:20,000 and 1:5,000 aluminum control sheets) does not show the high water line. The insert on Lieut. L. C. Wilder's field sheet "B" was used to obtain the detail around Shinnecock Canal since it is to a much larger scale, 1:5,000.

In addition to the triangulation and what high water line could be obtained from the Aluminum Control Sheets, the following topographic signals (shown on the
REVIEW

Station "CAW" - Lat. 40° 52.8', Long. 72° 30.1'. There is no question as to the correct spotting of the station on the photographs and the radial plot is well controlled. The radial plot is on a larger scale. It checks with the planetable sheets field letters A and B of L. C. Wilder as to location of stations just to the north in Shinnecock Canal and Great Peconic Bay.

The holes pricked for the station points of triangulation and topographic stations on T4765 are very large and the appearances of the sheet do not indicate careful planetable work.

The position given on the air photo sheet is considered the stronger location for this station.

Stations "ELK", Lat. 40°-52.9', Long. 72°-28.8'; and "LOG" Lat. 40°-52.9', Long. 72°-29.3'. Since the spotting of these stations on the photographs is questioned, the positions shown on A.C.S. T4765 should be accepted as correct unless verification of the hydrography shows some indication of error in those positions.

Changes shown in black ink to clarify the wording of the report on page 3 have been made after correspondence with Lieut. Bolstad.

B. G. Jones
Aluminum Control Sheets) were spotted on the photos and were used in controlling this sheet:

Ump
Let
Jet
Yol
Lone
Caw

Elk
Log
Flagpole
Windmill
Canoe Club Inn Flagpole (Big)
Rot (Robins Island)

They have been shown on the celluloid topographic sheet by a double blue circle (⊙) together with the name (as shown on the Aluminum Control Sheets) in blue. As the blue will not photograph during the photo-lithographic process no record of these topographic control signals (banners and flags) will appear on the finished sheet. Only recognizable stations will be shown on the finished sheet.

If it is the desire of the Chart Section to have these shown, they may be indicated in red ink with the usual circle and topographic name; this may best be done by draftsmen in the Washington Office as they will have all the data at hand.

All aluminum control stations used for supplementary control on this sheet have been plotted from the positions obtained by scaling directly from the Aluminum Control Sheets of this area.

(B) Errors.

In making the radial plot for this sheet the following relocations of spotted Aluminum Control Sheet signals resulted:

6 Log - new position as determined by the radial plot lies 2 meters distant on azimuth 182°-00' (from north) from the position as given on the aluminum control sheet. As this signal lies on a sandy beach and, under the stereoscope, was rather difficult to spot it is possible that it has been incorrectly spotted on the photographs. The intersection of the radial lines was fairly well defined and, for this reason,

6 Elk - new position as determined by the radial plot lies 11 meters distant on azimuth 110°-00' (from north) from the position as given on the aluminum control sheet. As this signal lies on a sandy beach and, under the stereoscope, was rather difficult to spot it is possible that is has been incorrectly spotted on the photographs. The intersection of the radial lines was, however, extremely well defined and, for this reason,

6 Caw - new position as determined by the radial plot lies 10 meters distant on azimuth 199°-00' (from north) from the position as given on the aluminum control sheet. This signal is the corner of a dock which is clearly visible under the stereoscope and well enough defined so that there is little doubt in its spotting. The signal, as taken from the aluminum control sheet, appears to be cut in the water.

See opposite page
The control, on this sheet, is in general strong and the radial plot gave very good intersections. The necessary adjustments are given under COMPILATION, (B) Adjustments of Plot. It is felt that all the above named signals are in error as listed. It is to be noted that the aluminum control sheets were executed on a scale of 1:20,000 and 1:5,000 whereas this sheet is on a scale of 1:10,000.

(C) Discrepancies.

The Long Island Railroad track traverse data, as listed by them, was found to be in error. The true azimuth is about 70° - 54' to the left (counter-clockwise) of the azimuth determined by them. The distances to cross roads, etc., in the traverse checked out correctly with the radial plot. It appears that the railroad traverse azimuth may have been based on a poor magnetic azimuth determined years ago.

No other scaleable discrepancies in the control positions were discovered.

COMPILATION.

(A) Method.

The usual radial line method of plotting was used in the compilation of this sheet.

(B) Adjustments of Plot.

The photographs of this strip appear to be free from excessive tilt and scale fluctuation (scale factor nearly 1).

The Long Island Railroad track traverse data was used between Hampton Bays and Longitude 72° 26' and, after the azimuth was revised as explained above under CONTROL, paragraph (C) Discrepancies, it was found to agree very well with the radial plot.

Topo stations "Die" and "How" (both buoys "Die" - Lat 41° 54' N, Long 72° 37' on a sandy beach) were not used in detailing this "How" - Lat 41° 54' N, Long 72° 36' sheet since their poor location made their accuracy questionable.

It is believed that the spotting of Triang Sta. Cedar may be in error on the photographs since it was impossible to hold to this station and at the same time hold to other control stations in the vicinity. The shore area and vicinity between Triang, Sta. Cedar and Triang, Sta. Squire Pond showed considerable tilt, making several radial points of no value. Triang Sta. Cedar, because of its location (on a sandy beach) and inaccuracy of plotting, was disregarded and Topo Sta. Csp (Windmill and Tank) was used for control with Triang Sta. Squire Pond in adjusting this area.

(C) Interpretation.

Only the usual graphic symbols were used as
approved by the Board of Surveys and Maps (1932) and no great difficulty was experienced in interpreting the photographic detail.

In the case of bluffs which occur on this sheet, along the shore of Great Pecanoe Bay and Robins Island, the standard symbol has been used and also a printed label attached.

The double full line was used to indicate first order roads and the double broken line for private driveways and roads of lesser importance. An exceedingly poor road or trail was shown as a single dashed line. In most cases (unless labeled on the field inspection prints) the classification had to be determined by the appearance under the stereoscope.

All boundaries of shoal water areas (shown by single broken line) on this sheet were so indicated because of appearance on the photographs and they may be expected to have departure from actual conditions. The shoal water area on this sheet is small.

(b) Information from Other Sources.

A portion of the Long Island Railroad track traverse from Hampton Bays to Longitude 72° 28' (edge of sheet) was used for control. This traverse was used only to assist the control for this section of the sheet.

The high water line and marsh line, except along the shore of Shinnecock Bay, was obtained directly from the photographs, there being no shore line given on the topo sheets. Along the shore of Shinnecock Bay the shore line, as taken from the aluminum control sheet executed under Lieut. A. P. Ratti in 1933, did not agree with that shown on the photographs between Topo Sta. Elk and Longitude 72° 28' by about 10 meters. No explanation could be given for this variation and the shore line was taken as shown on the photographs. See also page 6.

A tie-in traverse was also used as supplementary control from Triang. Sta. Canoe to Topo Sta. Big, a flagpole at Canoe Place Inn, and from there to an underpass to the north where it was tied in with the Long Island Railroad Traverse. This traverse was run in by Lieut. (j.g.) R. C. Bolstad while on field inspection in the party of Lieut. L. C. Wilder.

Topo Sta. Roc at longitude 72° 32' 00" (approx.) and longitude 40° 54' 30" (approx.) is a rock above high water a little off shore and its geographic position was obtained directly from the aluminum control sheet by scaling.

At approximately longitude 72° 29' 30" and latitude 40° 53' 15" there are three rocks slightly off shore, one of which is one foot above high water, another three and one-half feet above high water and the third awash at high water. The data concerning these rocks was obtained from the field print photographs and the notes thereon made by the field inspection party.
The shore line differences mentioned on the opposite page are not large, and shore line as shown on this sheet does not conflict with the soundings on Sheet N 5323. The differences are probably due to differences in interpretation and to sketching between rod readings. The plan table sheet is on 1:20,000 scale.

J. G. Jones
Between Triang. Sta. Squire Pond and Topo Sta. Let (E. gable white house) a small rock is shown approximately 179 meters off shore. One foot of this rock is bare at mean low water. For further information consult Lieut. L. C. Wilder's Hydrographic Sheet No. 1, Vol 4, pages 29 and 30.

At Shimneecook Canal there are two bridges of the fixed type, one a Railroad bridge and the other a Highway bridge, both at Canoe Place. The Railroad bridge clearance was 22.0 feet when the staff at the Highway bridge read 4.25 feet and the Highway bridge clearance was 19.6 feet when the same staff read 4.23 feet. This data is shown on the topographic sheet with a slight allowance for possible higher water. The data regarding these bridges was obtained by Lieut. (J.g.s.) R. C. Bolstad while on field inspection in the party of Lieut. L. C. Wilder.

For further detail of Shimneecook Canal reference should be made to the insert (scale 1:5,000) on Lieut. L. C. Wilder's Aluminum Control Sheet, 1933, Field Letter "B".

(E) Conflicting Names.

There are no names on this sheet conflicting with names shown on the U. S. C. & G. S. Charts of this area.

The name "Southport", shown on the U. S. Geological Chart, has been omitted on this sheet because of the fact that no buildings show on the photographs.

The names "Penney Pond", "Sears Pond", and "Bells Pond", which are shown on the U. S. Geological Charts, are shown only as Ponds on this sheet since they were not given any name on the field photographs by the field inspection party.

COMPARISON WITH OTHER SURVEYS.

The junctions with all adjoining sheets are satisfactory.

Since the shore line was not given on the aluminum control sheets, with the exception of the shore of Shimneecook Bay, no comparison could be made with other surveys. Where a comparison could be made along the shore of Shimneecook Bay with the aluminum control sheet of this area executed under Lieut. A. P. Ratti in 1933, Reg. No. 4765, there was disagreement between Topo Sta. of shore line Elk and longitude 72° 28'. There was a variation of about 10.0 meters for which no explanation could be given as has been stated under COMPILATION, (D) Information from Other Sources.

With the exception of Topo Sta. Roca (rock above high water) which was given on the aluminum control sheet the other rocks, given under COMPILATION, (D) Information from Other Sources, were not shown on the aluminum control sheet.

Since there were no shoal areas shown on the aluminum control sheets they were shown on this sheet as stated under COMPILATION, (C) Interpretation. Where a marked contrast between deep and shoal water was not apparent on the photographs, the broken dashed line was ended. This gradual blending from the appearance of shoal to deep water is due to the gradual increase in depth of the water. This sheet shows only the shoal areas apparent on the photographs.
LANDMARKS.

The list of chartable landmarks for this sheet includes eight objects, all of which have been marked with a small black circle. Two of these were submitted by Lieut. A. P. Ratti, August 1, 1933, and by Lieut. L. C. Wilder, November 4, 1933 and are as follows:

✓ Hampton Bays Silver Water Tank
✓ Canoe Place Inn Flag Staff

The remaining landmarks were submitted by Lieut. L. C. Wilder, November 4, 1933 and are as follows:

✓ White Windmill (Windmill with Tank)
✓ Light, No. entrance Shinnecock Canal (Jet)
✓ Chimney on Long House (E. Chim.)
✓ Windmill with Tank (Ump)
✓ White Flagpole near white windmill and red

In addition to the above the enclosed list of Class (c) objects is submitted. These should not be charted but have been shown on this sheet as they are prominent enough at this scale (about 1:10,000) and may be used to obtain hydrographic "fixes". "Jet" and "Ump", listed as Class (b), were scaled directly from the aluminum control sheet (Lieut. L. C. Wilder's Aluminum Control Sheet, Field Letter "B", 1933) and are marked with a small black circle. "Red" was scaled from the air-photo topography and is also marked with a small black circle.

All of the enclosed objects were spotted on the photographs by the field inspection party and were also used for supplementary control since they were located on the Aluminum Control Sheets.

Classification (c) objects - those are recoverable objects which can be identified at close range (about 1 to 2 miles) and may be used by the Light House Service - these should not be charted except on exceptionally large scale charts or where the hydrography is to be done on the regular air-photo topographic sheet.

There are also many other objects (such as shacks and houses, etc.) which are located within the accuracy specified in the following chapter, RECOMMENDATIONS FOR FURTHER SURVEYS, and may be used to obtain hydrographic "fixes". Care should be taken in using the houses to use the center as the size shown on this sheet may be expanded somewhat. See also Descriptive Report for Sheet, Reg. No. T5069, REPORT ON REVIEW OF SHEET, ADDITIONAL NOTES, (1) Landmarks.

The landmarks shown on this sheet and included in this report cover all landmarks (those previously submitted, those to be retained and any new landmarks) for the area covered by this sheet.
RECOMMENDATIONS FOR FURTHER SURVEYS.

The compilation of this sheet is believed to have a probable error of 2 meters in well defined detail of importance for charting and of 4 meters for other data. It is understood that the widths of roads, bridges and similar objects may be slightly expanded in order to keep the detail clear and to keep it from photographing as a solid area in the photo-lithographic process.

To the best of my knowledge this sheet is complete in all detail of importance for charting purposes, within the accuracy stated above, and no additional surveys are required.

REVIEW OF PHOTO TOPOGRAPHIC SURVEY NO. T5065

Title (Par. 56) (see enclosed Title Sheet)

Chief of Party Roswell C. Bolstad Compiled by (see enclosed data sheet)

Project New York Air-photo Compilation Instructions dated Nov. 15, 1932
Party No. 12

1. The survey and preparation for it conform to the requirements of the Topographic Manual. (Par. 6; and 16, a, b, c, d, e, g and i.) Paragraph 8 not applicable to this party.
(see paragraph CONTROL in COMPILER’S REPORT)

2. The character and scope of the compilation satisfy the instructions and the “Notes on the Compilation of Planimetric Line Maps from Five Lens Aerial Photographs”.

3. The control and adjustment of the radial plot were adequate.
(Par. 12, 29.) (see COMPILER’S REPORT enclosed, paragraph, Adjustments of Plot under COMPILATION (E)).

4. There is sufficient control on maps from other sources that were transmitted by the field party for their application to the charts. (Par. 28.) None submitted.

5. High water line on marshy coast is clear and adequate for chart compilation. (Par. 16a, 43, 44.)

6. The representation of low water lines, soundings and rocks, and legends pertaining to them is satisfactory. (Par. 36, 37, 38, 39, 40, 41.) See Parr. under compilation, page 4 of the desc. report.

7. Important details shown on previous surveys and on the chart have been compared with this sheet and a statement has been entered in the report regarding the removal from the chart or change in position of important detail such as rocks, lights, beacons, prominent objects, bridges, docks, and structures along the water front. Only such changes as noted in the enclosed COMPILER’S REPORT, CONTROL (B); COMPILATION, (D), (E); COMPARISON WITH OTHER SURVEYS and LANDMARKS have been made on this sheet.

8. The span, draw and clearance of bridges are shown. (Par. 16c.)
(see COMPILER’S REPORT, COMPILATION (D) Information from Other Sources) Staff referred to established by Lieut. L.C. Wilder in 1933.

9. The data furnished by the Field Inspection is adequate.

NOTE: Strike out paragraphs, words or phrases not applicable and modify those requiring it. Paragraph numbers refer to those in the Topographic Manual. Use reverse side for extending remarks.
10. The descriptive report covers all details listed in the Manual, so far as they apply to this survey. (Par. 64, 65 and 66.)

11. The descriptive report also contains all additional information required in photo topography as prescribed in the instructions and in the "Notes on the Compilation of Planimetric Line Maps from Five Lens Aerial Photographs".

12. The descriptions of recoverable stations and references to shore line were accomplished on Form 524, and scaling of positions checked. (Par. 29, 30 and 57.) (see Remarks Below). No descriptions on Form 524 were submitted with this sheet. The recoverable topographic stations shown on this sheet were transferred from the aluminum planimetric control sheets of A.F. Ratti and L.C. Wilder, 1933 except for 2 objects listed on page 10.

13. A list of landmarks for charts was furnished on Form 567 and scaling of positions checked. (Par. 185, i, 60.) See par. headed LANDMARKS on page 7 of the Descriptive Report.

14. The geographic datum of the sheet is North American 1927 and the reference station is correctly noted. (Par. 54.) (see paragraph CONTROL in Compiler's Report)

15. Junctions with contemporary surveys are adequate.

16. Geographic names are shown on the sheet and are covered by the Descriptive Report. (Par. 64, 66k.)

17. The quality of the drafting is good. (Par. 31, 32, 33, 35, 36, 37, 38, 39, 40, 41, 42, 45, 46.)

18. No additional surveying is recommended.

19. Remarks: Any additional notes and requirements affecting this area are referred to Lieut. A. F. Ratti's and Lieut. L. C. Wilder's Descriptive Reports covering the topography executed in 1935 under their charge.

20. Examined and approved: Roswell C. Holsted
   Chief of Party

21. Remarks after review in office: This sheet is well controlled and has been carefully compiled. The report is complete.

Reviewed in office by: JG Jones

Chief, Division of Charts

Chief, Section of Field Work

Chief, Division of Hydrography and Topography.
REVIEW OF SHEET

ADDITIONAL NOTES.

(1) Robins Island.
Robins Island has been shown on this sheet as an insert. The compilation was made from the single lens photographs H20 (6811-6) to H25 (6811-8) inclusive taken at 10:30 A.M., September 19, 1933. At this time the stage of tide at South Jamesport (from 1933 Predicted Tide Tables) was practically high water.

(2) Rocks.
The three rocks mentioned in the Compiler's Report, paragraph (D) Information from Other Sources, are comparatively unimportant as far as navigation is concerned as they lie along the high water line. They have been shown, however, as spotted on the field prints and may be used as recoverable objects for future re-surveys.

(3) Bridges.
The following data was obtained from the 1st District U. S. Army Engineers:

<table>
<thead>
<tr>
<th>Clear width</th>
<th>Clear Height above H.W.</th>
<th>Kind</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shinnecock Canal Highway Bridge</td>
<td>105 feet</td>
<td>20.0 feet</td>
</tr>
<tr>
<td>L. I. R. R.-Shinnecock Canal Bridge</td>
<td>79 feet</td>
<td>21.0 feet</td>
</tr>
</tbody>
</table>

The minimum clearance, as explained in the Compiler's Report, was used. The actual navigable width clearance can be accurately obtained by scaling the channel width on Lieut. L. C. Wildor's 1933 Aluminum Control Sheet, Field Letter "B" (1:5,000 scale insert).
