DEPARTMENT OF COMMERCE
U. S. COAST AND GEODETIC SURVEY
R. G. Patton, Director

State: New York

DESCRIPTIVE REPORT
Topographic Sheet No. T5083
Hydrographic

LOCALITY
South Shore of Long Island
Outer Coast between Potunk Point
and Reeves Island

1933

CHIEF OF PARTY
Roswell C. Bolstad, Jr., H. & G. E.
TOPOGRAPHIC TITLE SHEET

The Topographic Sheet should be accompanied by this form, filled in as completely as possible, when the sheet is forwarded to the Office.

Field No....32

REGISTER NO. T6085

State...New York

General locality...South Shore of Long Island

Locality...Outer Coast between Potunk Point and Reeves Island

Scale 1:10,000 Date of Photographs Feb. 22, 1933

Date of Compilation Nov. 18, 1933

Reviewed and recommended for approval

Chief of party...Roswell C. Bolstad, Jr. H & G. Ea.

Surveyed by...U. S. Army Air Corp

Inked by...William Barasch

Heights in feet above....to ground to tops of trees

Contour, Approximate contour, Form line interval.....feet

Instructions dated.....November 15

1932

Remarks: Actual scale of celluloid sheet is 1:9,479. Final

sheet to be reduced to 1:10,000 scale and printed by photogr.
lithographic process. Compilation of single lens aerial
photographs Nos. V-67 to V-86.

Polyconic Projection by J. P. O'Donnell Sept. 30, 1933
Projection Verified by R. C. Bolstad Sept. 30, 1933
Control Plotted by J. F. Jones Oct. 2, 3, 1933
Control Verified by J. C. Harmon Oct. 3, 1933
FIELD REPORT
for
AIR PHOTO TOPOGRAPHIC SHEET FIELD NO. 32

No report has been submitted by the field inspection party for this area. Reference is made to the notes submitted in the field report as listed in the descriptive report for Air-photo Topographic Sheet, Reg. No. T5080.

CONTROL.

This sheet is controlled by the triangulation executed by the parties of Lieut. Comdr. R. P. Eyman (center and west portion of sheet) and Lieut. A. P. Ratti (east end of sheet) carrying on combined operations during the 1933 season. Topography (1:20,000 scale aluminum control sheet, showing high water line and control signals) executed by the party of Lieut. A. P. Ratti forms the basis of supplementary control for this sheet.

LIST OF NAMES.

No new names were submitted nor labeled on the field print photographs by the field inspection party.

MISCELLANEOUS.

Any additional notes and requirements affecting this area are referred to the reports of Lieut. Comdr. R. P. Eyman (for triangulation as stated above) and Lieut. A. P. Ratti (for balance of triangulation and topography) during the 1933 season.

Submitted by Roswell C. Bolstad

* The position given for Ich, 1933 is Lieut. Comdr. R. P. Eyman's unadjusted position which does not agree exactly with that submitted by Lieut. A. P. Ratti but the difference is unplottable.
COMPILER'S REPORT
for
AIR PHOTO TOPOGRAPHIC SHEET FIELD NO. 32

GENERAL INFORMATION.

The only available aids in the compilation of this sheet have been secured from the notes on the field prints, the preceding report on field inspection, and additional information furnished by Lieut. (j.g.) R. C. Bolstad in questionable areas.

The accompanying NOTES ON COMPILATION details all data in connection with compilation of this sheet.

There is very little tide in Shinnecock Bay (about \( \frac{3}{4} \) foot range at Bellport, from predicted tide tables) and its effect was neglected. Along the outer coast the tide was about 2 feet below mean high water (from predicted tide tables) at the time these photographs were taken but the interpretation of the high water line from the photographs was not affected by this as explained in the field report inclosed in the descriptive report for Air-photo Topographic Sheet Reg. No. T5050.

This sheet was compiled from the photographs taken Feb. 22, 1933 at 11:20 A. M. by Captain Willis R. Taylor of the U. S. Army Air Corps with their single lens camera and covers the compilation of photograph numbers V-87 (881-6) to V-85 (881-8) inclusive.

CONTROL.

(A) Sources.

The following sources of control were used in the compilation of this sheet:

(a) Triangulation by R. P. Elyman in 1933.
(b) Triangulation by A. P. Ratti in 1933.
(c) 1933 Aluminum Control Sheet, Reg. No. 7474.

The field party's geographic positions were used; these are on the N. A. 1927 Datum. The difference between the unadjusted and the final adjusted positions would be unplottable at the scale of this compilation (1:9,479).

In addition to the triangulation, and the high water line from the Aluminum Control Sheets, the following topographic signals (shown on the Aluminum Control Sheets) were spotted on the photos and were used in controlling this sheet:

<table>

</table>
On page 10 of this report, is listed a difference of seven meters in the location of station Zip. The spotting of this object on the photographs is not questioned and the position as given by this sheet T5063 is considered correct. The difference of .35 M M is barely larger than the size of the hole pricked for the station point on T4764.

Stations Hag, Hos and Yap. The radial plot is strong for these locations and the spotting of the objects on the photographs is not questioned. The appearances of T4764 do not indicate careful planetable work. These stations are considered correct as shown on the air photo sheet.

Station Rac. Since the spotting of this object on the photographs is questioned, the position as shown on the aluminum planetable control sheet T4763 should be considered correct unless the verification of the hydrography indicates an error in that position.

Station Fat. This station is near the center line of the photo flight and the intersection locating it on the air photo sheet is weak, particularly in the East-West direction. However, the station cannot logically be moved down to agree with the position given on T4764. The air photo sheet agrees with T4765 for a number of other stations in this vicinity and the radial plot is well controlled. The difference of 13 meters is not large when plotted on the 1:20,000 scale on T4764 and could have been caused by a small error in orienting the planetable. The large holes pricked for triangulation and topographic station marks on T4764 do not indicate careful planetable work.

The air photo sheet is on a scale of 1:9479 and is considered to give the stronger position for this station.

J.G. Jones
They have been shown on the celluloid topographic sheet by a double blue circle (○) together with the name (as shown on the Aluminum Control Sheets) in blue.

(B) Errors.

In making the radial plot for this sheet the following relocations of spotted Aluminum Control Sheet Signals resulted:

- Rec - new position as determined by radial plot lies 12 meters distant on azimuth 137°- 24' (from north) from the position as given on the Aluminum Control Sheet. This signal was spotted on the field print by the field inspection party and the spotted position could not be verified by the office compilation party, therefore, the error may be due to wrong spotting rather than to an erroneous position on the Aluminum Control Sheet. However, the air-photo shore line at this point agrees well with the Aluminum Control Sheet shore line.

- Fat - new position as determined by radial plot lies 13 meters distant on azimuth 137°- 36' (from north) from the position as given on the Aluminum Control Sheet. This signal is a chimney on the north end of a house and is easily identified with the aid of the stereoscope so there could be no question as to the spotting on the photograph. Signal Fag and the shore line in this vicinity check the radial plot location so it appears that this signal has been erroneously located on the Aluminum Control Sheet.

- Hag - new position as determined by the radial plot lies 11 meters distant on azimuth 24°- 36' (from north) from the position as given on the Aluminum Control Sheet. As this signal is a small shack and is easily identified with the aid of the stereoscope the spotting on the photograph cannot be in error.

- Hos - new position as determined by the radial plot lies 6 meters distant on azimuth 206°- 44' (from north) from the position as given on the Aluminum Control Sheet. This signal is located on a point and the spotting is very unlikely to be in error.

- Yap - new position as determined by the radial plot lies 8 meters distant on azimuth 247°- 40' (from north) from the position as given on the Aluminum Control Sheet. As this signal is a chimney on a house it is readily distinguishable on the photograph so that the spotting cannot be in error.

The control is strong for this sheet and the radial plot gave good intersections. It is felt that all the above listed signals are in error as listed. It is to be noted that the aluminum control sheet was executed on a scale of 1:20,000 whereas this sheet is on a scale of 1:9,479.

See opposite page
There appears to be a conflicting name on this sheet, the name Potunk, near West Hampton Beach, being given on the U.S. Coast and Geodetic Survey Charts as Petunk. It should be Potunk as it is printed that way on the Coast Guard Building there and is given as Potunk on the Aluminum Control Sheet and the U.S. Geological Survey map of that area.

Potunk Pt. is U.S.G.S. decision
T.M.P. 1937
(C) **Discrepancies.**

No other control stations established by other organizations were used in this compilation.

**Compilation.**

(A) **Method.**

The usual radial line method of plotting was used in the compilation of this sheet.

(B) **Adjustments of Plot.**

The photographs in this strip appear to be free of excessive tilt and scale fluctuation and the radial plot required no unusual adjustments.

(C) **Interpretation.**

Only the usual graphic symbols were used as listed in the Coast Survey Topographic Manual and those approved by the Board of Surveys and Maps (1932). No great difficulty was experienced in interpreting the photographic detail.

The ridge of sand dunes running along the outer coast were clearly evident under the stereoscope although the exact boundaries, as shown, may be somewhat in error.

The double full line was used to indicate first order roads and the double broken line used for private driveways and roads of lesser importance. An exceedingly poor road or trail was shown as a single dashed line. In most cases (unless labeled on the field inspection prints) the classification had to be determined by the appearance under the stereoscope.

All boundaries of shoal water areas (shown by single broken line) on this sheet were so indicated because of appearance on the photographs and they may be expected to have departure from actual conditions.

(D) **Information from Other Sources.**

The high water line and marsh line was run in by the topographic party on the aluminum control sheets.

(E) **Conflicting Names.**

There are no names on the sheet conflicting with names shown on the U.S.C. & G.S. Charts of this area. All new names shown were taken from the recent editions of U. S. Geological Survey Maps of that locality. See opposite page.

**Comparison with Other Surveys.**

This sheet makes a junction with the Air-photo Topographic Sheet, Reg. No. T5052 in the vicinity of longitude 72° 39'. As there is a wide variation in the scale of the
REVIEW

The point of land at the west side or Moriches Inlet as shown on this sheet T5083 extends out over a seven foot sounding shown on R5322 and extends about 70 meters farther northwest than the same point as shown on the aluminum control sheet T4768.

The photographs were taken February 22, 1933, and Lieutenant Bolstad's field inspection party made adequate measurements for defining the high water line on the photographs.

The difference in location of the shoreline on this point as shown on the two sheets represents the change between the date of the photographs and the date of the planetary survey which is given in the Descriptive Report for T4768 as from April to June, 1933.

The shoreline from the photos has been retained on the air photo sheet and the shoreline from the planetary sheet is also shown as a heavy broken line with an appropriate note.

B.G. Jones
two sheets it was very difficult to obtain a satisfactory
junction; this had to be done by subdividing the sheet in
this area into small squares and proportioning the detail
within each square after which it was checked by the pro-
portional dividers. Should a discrepancy between the
junctions exist the detail on this sheet should be adhered
to as the control and radial plot are stronger.

The high water line as shown on the aluminum control
sheet agrees well with the high water line as shown on the
Air-photo Topographic Sheet. The inner shore line and marsh
line agree well in general with variations where a rugged
shore line occurs. The shore line as run in on the aluminum
control sheets is shown on the celluloid compilation sheet
in blue and any variations from the air-photo shore line is
readily apparent.

LANDMARKS.

There are no lists of landmarks available within this
area which have been recommended either by the field inspec-
tion party or the combined operations party under Lieut.
A. F. Rettig operating in this vicinity.

With the assistance of Lieut. (j.g.) R. C. Bolstad who
is familiar with this locality and by the aid of the ster-
escope the objects listed under LANDMARKS (Form enclosed)
are submitted. They are grouped according to the following
classification:–

Classification (A) Extremely prominent - can be seen
from a long distance - to be shown
on both large and small scale charts.

Classification (B) Prominent - can be readily identified
at close range but may lose prom-
inence at a distance (about 3 miles)-
to be shown on large scale charts only.

Classification (C) Landmarks of minor prominence - these
are recoverable objects which can be
identified at close range (about 1 to
2 miles) and may be used by the Light
House Service - these should not be
charted except on exceptionally large
scale charts or where the hydrography
is to be done on the regular air-photo
topographic sheet.

There are no Class (A) Landmarks on this sheet.

There are many other objects (such as shacks and houses,
etc.,) which are located within the accuracy specified in the
following chapter, RECOMMENDATIONS FOR FURTHER SURVEYS, and
may be used to obtain hydrographic "fixes". Care should be
taken in using the houses to use the center as the size shown
on this sheet may be expanded somewhat.

RECOMMENDATIONS FOR FURTHER SURVEYS.

The compilation of this sheet is believed to have a
probable error of 2 meters in well defined detail of importance for charting and of 4 meters for other data. It is understood that the widths of roads and bridges and similar objects may be slightly expanded in order to keep the detail clear and to keep it from photographing as a solid area in the photo-lithographic process.

To the best of my knowledge this sheet is complete in all detail of importance for charting purposes, within the accuracy stated above, and no additional surveys are required.

Note: A. P. T. stands for Air-photo Topography.

For classification (shown in parenthesis after description) see paragraph Landmarks in Descriptive Report for Air-photo Topographic Sheet, Reg. No. T5083.

* These stations are very prominent under the stereoscope and could be listed as Class (B) landmarks to be charted on Us S. C. & G. S. Chart 578. However, since they were not submitted by Lieut. A. P. Ratti in his Report of August 1, 1933 they have been listed here as Class (C) landmarks.
Review -

None of the topographic relations cited on the foregoing page are shown on this sheet as topographic relations. On this sheet the full height of the houses are shown without the point within a circle signifying a topographic relation.

### Notes

- A.C.S. stands for Aluminum Control Sheet and A.P.T. for Air-Photo Topography.

- Name preceding description in parenthesis indicates topographic name shown on Aluminum Control Sheet.

- For classification (shown in parenthesis after description) see paragraph Landmarks in Descriptive Report for Air-photo Topographic Sheet, Reg. No. T5003.

- Corrected Aluminum Control Sheet position obtained from Air Photo Topography. See also opposite page.
Title (Par. 56) (See enclosed Title Sheet)

Chief of Party Roswell C. Bolstad    Compiled by (See enclosed data sheet)

Project New York Air-Photo Compilation Instructions dated Nov. 15, 1932
Party No. 12

\(\text{1}.\) The survey and preparation for it conform to the requirements of the Topographic Manual. (Par. 8; and 16, a, b, c, d, e, g and i.) Paragraph 8 not applicable to this party. (See paragraph CONTROL in COMPILER'S REPORT)

\(\text{2}.\) The character and scope of the compilation satisfy the instructions and the "Notes on the Compilation of Planimetric Line Maps from Five Lens Aerial Photographs".

\(\text{3}.\) The control and adjustment of the radial plot were adequate. (Par. 12, 29.)

\(\text{4}.\) There is sufficient control on maps from other sources that were transmitted by the field party for their application to the charts. (Par. 28.) 
Nine submitted

\(\text{5}.\) High water line on marshy and mangrove coast is clear and adequate for chart compilation. (Par. 16a, 43, 44.)
See mudflat and shoal areas

\(\text{6}.\) The representation of low water lines, mudflats, and legends pertaining to them is satisfactory. (Par. 36, 37, 38, 39, 40, 41.) See Page 6 of desc. report

\(\text{7}.\) Important details shown on previous surveys and on the chart have been compared with this sheet and a statement has been entered in the report regarding the removal from the chart or change in position of important detail such as rocks, lights, beacons, prominent objects, bridges, docks, and structures along the water front. No changes in such details have been noted on this sheet.

\(\text{8}.\) The span, draw and clearance of bridges are shown. (Par. 16c.)
Data as shown obtained from Aluminum Control Sheet, Lieut. A. F. Retti's Field Sheet No. 4784.

\(\text{9}.\) The data furnished by the Field Inspection is adequate. (See enclosed Field Report)

NOTE: Strike out paragraphs, words or phrases not applicable and modify those requiring it. Paragraph numbers refer to those in the Topographic Manual. Use reverse side for extending remarks.
10. The descriptive report covers all details listed in the Manual, so far as they apply to this survey. (Par. 64, 65 and 66.)

11. The descriptive report also contains all additional information required in photo topography as prescribed in the instructions and in the "Notes on the Compilation of Planimetric Line Maps from Five Lens Aerial Photographs".

12. The descriptions of recoverable stations and references to shore line were accomplished on Form 524, and scaling of positions checked. (Par. 29, 30 and 57.) (See enclosed Field Report and Remarks below.) The 2 stations described on page 8 were located solely by this compilation and no descriptions on Film 564 were submitted for those stations.

13. A list of landmarks for charts was furnished on Form 587 and scaling of positions checked. (Par. 16d, e, 60.) Furnished by A. P. Ratti, 1933. See also pages 5 and 10 of this report.

14. The geographic datum of the sheet is North American 1927 and the reference station is correctly noted. (Par. 34.) (See paragraph CONTROL in COMPILER'S REPORT.)

15. Junctions with contemporary surveys are adequate.

16. Geographic names are shown on the sheet and are covered by the Descriptive Report. (Par. 64, 66k.)

17. The quality of the drafting is good. (Par. 31, 32, 33, 35, 36, 37, 38, 39, 40, 41, 42, 45, 46.)

18. No additional surveying is recommended.

19. Remarks: Any additional notes and requirements affecting this area are referred to Lieut. A. P. Ratti's reports covering the topography executed in 1933 under his charge.

20. Examined and approved:

REPORT ON REVIEW OF SHEET

Air-photo Topographic Sheet, Reg. No. T5033, has been reviewed together with the Descriptive Report and all requirements are satisfied in accordance with requirements of the U. S. C. & G. S. Topographic Manual and pamphlet NOTES ON THE COMPILATION OF PLANIMETRIC LINE MAPS, 1933.

No additional surveying is recommended.

ADDITIONAL NOTES.

(1) Landmarks.

The list of landmarks for this sheet was not received until after the completion of both the sheet and the Compiler's Report. All the necessary chartable landmarks were submitted by Lieut. A. P. Ratti, August 1, 1933 and includes only two objects:

✓ Potunk Coast Guard Flagstaff
✓ Moriches Coast Guard Flagstaff

In addition to the above the enclosed list of Class (C) landmarks is submitted. These should not be charted but have been shown on this sheet (with a small black circle) as they are prominent enough on this scale (about 1:10,000) and may be used to obtain hydrographic "fixes". They were spotted on the photographs by the field inspection party and were also used for supplementary control (since many of them were located on the Aluminum Control Sheet).

(2) Control.

All aluminum control stations used for supplementary control on this sheet have been plotted from the scaled positions obtained directly from the A. C. Sheets.

In regard to the last paragraph under CONTROL, (A) Sources, in the preceding COMPILER'S REPORT, as the blue will not photograph during the photo-lithographic process no record of these topographic control signals (banners and flags) will appear on the finished sheet.

If it is the desire of the Chart Section to have these shown, they may be indicated in red ink with the usual circle, and topographic name; this may best be done by draftsmen in the Washington Office as they will have all the data at hand.

The supplementary control station, Zip, was found to be in error on the aluminum control sheet and was not listed in the preceding COMPILER'S REPORT. The new position as determined by the radial plot lies 7 meters distant on azimuth 260° (from north) from the position as given on the aluminum control sheet. The spotting of this signal would very unlikely be in error.
because of the well defined detail in this vicinity.

(3) Sheet Junctions.

The method of making sheet junctions where a large variation in scale between the two sheets exists (as explained in the preceding COMPILER'S REPORT) was resorted to in order to eliminate the additional work of making a tracing of the junction detail and to save the time involved in forwarding to the Washington Office for photostating to the proper scale and returning (besides holding up both sheets involved, pending the return of the photostats).

(4) Wreck.

A ship wreck has been shown on this sheet at latitude 40° 45' plus, longitude 72° 45' plus, (in the vicinity of Triang. Sta. Tut, 1933). This wreck was not shown on the aluminum control sheet of this area but does show on the photographs and was noted on the field photographs by the field inspection party. It appears from stereoscopic inspection that part of this wreck is above the water level.

(5) General.

It has been the endeavor in the compilation of this sheet and accompanying Descriptive Report to make it as complete as possible in all respects but due to the lack of data furnished by the field parties and in the absence of a report by the field inspection party, the compilation had to be carried on as best it could be with the data at hand. This involved additional time in the compilation but the sheet is believed to be complete in accordance with all requirements.
