STATISTICS (III)

Land Area (Sq. Statute Miles): 23.3 mi.

Shoreline (More than 200 meters to opposite shore): 0

Shoreline (Less than 200 meters to opposite shore): 11.8 mi.

Number of Recoverable Topographic Stations established: 2

Number of Temporary Hydrographic Stations located by radial plot: 9

Leveling (to control contours) - miles:

Roman numerals indicate whether the item is to be entered by, (II) Field Party, (III) Compilation Party, or, (VI) the Washington Office.

When entering names of personnel on this record give the surname and initials (not initials only).

Remarks:
CONTROL

Reference is made to the field inspection report of the Suisun Bay Area in which the triangulation stations used to control this sheet are listed. Filed in Div. of Photogrammetry-General Files.

Station SHEEP, 1942, could not be identified on the photographs, therefore Field Inspection Point "Gravel", a nearby "T-road" intersection, was identified by the field party. This F.I.P. was picked on four photographs and used for control with good results. See review report

Field Inspection Point "Trail" relating to triangulation station KIRBY, 1922, falls just outside the detailing limits of this sheet and should have been used as control. However, it is a very poor point and could not be accurately identified on but one photograph on this sheet and proved of very little use in controlling the detail in its vicinity.

Station Three Point No. 2, 1941, was plotted on this survey sheet by using a metal 3-arm protractor, after a three-point problem had been computed to obtain the angles. Good results were obtained by using this station as control in the main radial plot and in holding it to "cut-in" additional radial points during the detailing of the sheet.

Form 524 Card filed in Div. of Photogrammetry-General Files.

MAIN RADIAL PLOT

A continuous radial plot was run on December 16-19th inc., for the purpose of locating all photograph centers, all hydrographic stations, topographic stations, bench marks, azimuth marks, and radial points. The plot extended over the area covered by sheets T-5946 to T-5952 inclusive. This area is the northern two-thirds of Nautical Chart 5534 taking in Grizzly Bay (approximate Lat. 38° 06'') on the south and the town of Fairfield (approximate Lat. 38° 15'') on the north and extending from approximate longitude 121° 55' westward to approximate longitude 122° 10'.

The usual practice of laying the plot was followed. This consisted of plotting the control on the survey sheets and then transferring it to the base grid sheets by matching grid squares. The agreement between the grid lines on survey sheets and those on the base grid sheets was excellent and no adjustment was necessary. However, when the base grid sheets were laid on the plotting table a small amount of adjustment had to be made between the grid lines on the northern part of sheets T-5947, T-5948 and those on the south part of sheets T-5949, T-5950, T-5951. The reason for this was that the projections for sheets T-5947 and T-5948 had to be made over and the new projections were not identical. This adjustment did not exceed 5 m. However, and it was distributed so as to fall in the least important areas.
This plot joins a previous plot covering sheets T-5941-T-5945 inclusive. A satisfactory tie-in was made as the overlapping points from this previous plot to the south were transferred to the base grids by matching grid squares and pricking the points direct. Report for this plot in the Descriptive Report for T-5945 filed in Div. of Photogrammetry General Files.

Control, in general, was of adequate density. However, areas of questionable accuracy due to lack of control will be discussed in a later paragraph.

Accuracy in identifying the following control stations was questionable to the extent noted:

The geographic position for station Three Point No. 1 could not be computed from available data, therefore, it could not be used in the radial plot. However, the station could be identified with reasonable accuracy on 4 photographs and its geographic position scaled and listed on Form 524. Station is in survey T-5747. Form 524 filed in Div. of Photogrammetry General Files.

Station DURF, 1942 was very difficult to accurately identify. While it was identified on 4 photographs its picked position is somewhat questionable. Station is in the area covered by T-5948.

The same is true of stations ROCKVILLE, 1932 and THOMASSON, 1922. Due to the area in which these stations are located it was not possible to be sure of their accuracy of identification on the photographs. Stations are in the area covered by T-5949.

Station SMALL RED TANK, 1922, apparently has been destroyed. The tank identified by the field party does not fit the plotted position on the survey sheet by some 200 to 300 meters in longitude. The position of SMALL RED TANK was recomputed in this office and found to be correct. Therefore, as no tank appears on the photograph where the plotted position calls for, it is believed that the station is destroyed. The station was of no value in the radial plot. Station is in the area covered by T-5950.

Station GRIZZLY ISLAND BARN, WEST GABLE, 1922, could not be furnished by the field party as there are two barns close to each other and the field party could not determine which was the station. The station can be used by the draftsman, however, as he will be able to determine which is the correct barn. Station is in the area covered by T-5951.

Station GRIZZLY ISLAND SHED, SOUTH GABLE, 1922, has apparently been destroyed as the plotted position does not coincide with any building in the area.

Field Inspection Point TRAIL, relating to triangulation station KIRBY, 1922, is not a good point as it was very difficult to accurately identify on the photographs and at best it had to be considered questionable. Station is in the area covered by T-5952.

Photographs were adequate in all areas except the easternmost parts of sheets T-5946 and T-5952; also the westernmost part of sheets T-5948 and T-5949 were not adequately covered. The accuracy of these areas
will have to be considered questionable as the photographs permit but 2-cut intersections in many instances and as the terrain is hilly the
detail may not be accomplished with the desired accuracy.

The two-cut intersections will be indicated as such on the survey
sheet. All other points were picked at the intersection of from 3 to 9
radial lines. All points are believed to be picked within .25 m.m. of
their true position.

Attention is called to the geographic position of station POND, 1942.
A position computation was made of this station in the Tampa office, and
the position furnished by the field party was found to have an error of
1 minute in Longitude. The correct geographic position of station POND,
1942 is - Lat. 38° 12' 25"N, Long. 121° 52' 50"W. Station is in the area
covered by T-5242.

Various colored inks were used on the photographs and survey sheet
to designate triangulation stations, topographic and hydrographic stations,
and radial points. The following key is furnished for future reference:

PHOTOGRAPHS
Triangulation and traverse stations........2.5 m.m. blue circle
Hydrographic and topographic stations.....2.5 m.m. green circle
Radial points in main plot................2.5 m.m. red circle
Photograph centers.......................Double White circle

SURVEY SHEET
Triangulation and traverse stations........3.5 m.m. high black triangle
Hydrographic and topographic stations.....2.5 m.m. black circle
Radial points on main plot................2.5 m.m. blue circle on
back of sheet
Radial points (additional)...............3.5 m.m. blue circle on
back of sheet
Photograph centers.......................Double blue circle on
back of sheet

28. DETAILING

The detailing of this sheet was done in accordance with the current
instructions.

The photographs were very clear and the only difficulty in interpre-
tation of vegetation was in distinguishing between land used as pastures
and marsh land in some of the lowland areas.

Field inspection is considered adequate for detailing.

Attention is called to a discrepancy in the name of the railroad
running north and south on this sheet. On Nautical Chart No. 5534 it is
labeled the S.F. & S. RR. On U.S. Geological Survey ANTIQUO CALIFORNIA
QUADRANGLE map, General Highway Map of Solano County and on Sheet T-5020
formerly compiled by this bureau the name of this railroad is shown as
the Sacramento Northern. The railroad is labeled on the survey sheet as
S.F. & S. RR.

Changed to Sacramento Northern Railway by reviewer. See
approved list of Geographic Names (part of this report)
SUPPLEMENTAL DATA

No graphic control survey of this area was available in this office for comparison.

LANDMARKS AND AIDS TO NAVIGATION

There are no prominent uncharted landmarks nor non-floating aids within the detailing limits of this sheet. Form 567 made out for the San Francisco-Medford Aerial Survey No. 3, 1932. Copies forwarded to Nautical Charts and Aeronautical Charts Sections.

HYDROGRAPHIC CONTROL

There are 9 unmarked hydrographic stations on this sheet that may be recovered for future use by the hydrographic party. Reference is hereby made to the field inspection report of Lieut. Comdr. L. D. Graham covering the Suisun Bay Area, in which these stations are listed. This report was submitted by Lieut. Comdr. Graham to the Washington Office in 1941.

COMPARISON WITH EXISTING TOPOGRAPHIC QUADRANGLES

The U.S. Geological Survey quadrangle map ANTIOCH CALIFORNIA covers this area. This quadrangle map was corrected as of 1936 and is in good agreement, generally speaking, with this survey sheet. However, due to a large scale difference the comparison was a visual one. The changes indicated are mostly in the marsh areas where a considerable portion of the land has been converted to pasture and in some instances to cultivation.

COMPARISON WITH NAUTICAL CHARTS

Visual comparison was made with Coast & Geodetic Survey Nautical Chart No. 5534 (1:40,000 scale), corrected to Aug. 12, 1942. Numerous levees and drainage ditches have been constructed in the southwestern part of the sheet which do not appear on the nautical chart. Most of this area has been reclaimed as pasture and cultivated land, thus necessitating the above changes. This map compilation should supersede the charted information.

Respectfully submitted,

Oscar M. Rivera

Forwarded by:

Kenneth G. Crosby
Chief of Party...
Subject numbers not used in this report have been adequately covered in other parts of the descriptive report.

26. **Control.**

The station "Sheep", 1942 and the substitute station "Gravel", both of which were unmarked, were removed from the map manuscript. Station "Sheep" was located by the field inspection party with sufficient accuracy for the control of the radial plot but it is of less than third order accuracy. The computations are filed in the Bureau library.

The triangulation station, "Meins 2", 1922, was added to the map manuscript.

**Comparison with Existing Topographic Surveys.**

The surveys are in good agreement with the map manuscript with the following exceptions:

The shoreline of Montezuma Slough, south of Meins Landing, because of the construction of levees.

Many ditches, levees, buildings, and roads are shown on the map manuscript that do not appear on the surveys.

**Comparison with Nautical Charts.**
