Summary to Accompany Descriptive Report T-8633 to T-8639

Topographic maps T-8633 to T-8639, inclusive, are seven similar maps in project Ph-34(48). These maps cover that area of the Rat Islands comprising Kiska Island, Little Kiska Island and Tanadak Island. There are also a number of small rocky islets, some named, close to these larger islands. The maps were compiled by stereo-instrument methods using the nine-lens Reading plotter. The field operations preceding compilation included partial inspection of shoreline and foreshore areas, the recovery of horizontal control, the establishment of additional horizontal control and the determination of elevations to control the stereo-instrument project vertically. The compilation was at a scale of 1:20,000 with a contour interval of 50 feet supplemented by a contour interval of 25 feet where needed.

Each manuscript in this series of seven maps is 7½' in latitude by 10' in longitude. None of the maps were field edited.

Depth curves and critical soundings are to be applied to the manuscripts by the Division of Charts. These features do not appear on the preliminary registration prints.

A single descriptive report was prepared for these seven maps. A cloth-backed lithographic print of each map, at compilation scale, will be registered with the combined descriptive report in the Bureau Archives. After publication, a cloth-backed color print of each map will also be registered.

PHOTOGRAMMETRIC PLOT REPORT

PROJECT PH-34(48)

SURVEYS T-8633 to T-8639, incl.

21. AREA COVERED:

This radial plot covers the area of Surveys T-8633 through T-8639. They are topographic surveys of Kiska, Little Kiska, and Tanadak Islands, Rat Islands, Alaska.

22. METHOD — RADIAL PLOT:

Map Manuscripts— Vinlyite sheets with polycrnic projections in black and Universal Transverse Mercator grids in red, at a scale of 1:20,000, were furnished by the Washington Office. No base sheets were required as the radial plot was constructed directly on the map projections.

All control stations and substitute stations were plotted using the beam compass and meter bar.

A sketch, showing the layout of surveys in this plot and the distribution of identified control and photograph centers, is attached to this report.

Photographs— All photographs used are nine lens metal mounted photographs at a scale of 1:20,000. Thirty-seven (37) photographs were used in this plot numbering as follows —

34,205 thru 34,218
34,220 thru 34,225
34,227
34,229 thru 34,231
34,233 and 34,234
34,239 and 34,240
34,243 thru 34,247
34,251 thru 34,254

The symbols used on the photographs were given in special instructions for all radial plots using nine lens photographs which will be used later for compilation with the Reading Plotter.

Eleven other photographs were also furnished but were not needed for a satisfactory plot and will not be needed by the Reading Plotter.
Templets

Vinylite templets were made from all photographs using a master templet furnished by the Washington Office to adjust for error due to chamber displacements. Radial lines were scratched on the templets with a sharp needle point and the scratches were filled in with China marking pencils. Red pencil was used for all shoreline (rectification) pass points and black was used for all other radial lines.

Closure and adjustment to control

The radial plot was constructed directly on the map manuscripts. A preliminary plot was laid to determine whether there were any badly tilted photographs. The amount of tilt can be estimated by observing the displacement of the image points, indicated by red dots on the templets, of shoreline points and points of known elevations. Several photographs were found to be slightly tilted but not enough to affect the plot. However, photograph 34205 is badly tilted.

The final plot was started with the flight beginning with 34220, extending that flight northward, then the flights to the west and finally the southern flight.

There was an excessive amount of control and it was impossible to hold all of it. Stations which were felt to be well identified were naturally given preference and five stations, whose positions were considered weak, were disregarded.

Photograph 34205 was badly tilted and was laid last so as to have no effect on the plot. The center falls in water and its position is considered weak.

Transfer of points

The positions of all centers, pass points, and control stations were pricked on the top templets and circled with 3mm. blue circles. The points were then established on the remaining templets and the map manuscripts by drilling down through them with a small (.01 inch) jeweler's drill. All points were circled on each templet as it was removed and on the map manuscripts.

23. ADEQUACY OF CONTROL:

As stated previously there was more than enough control for a satisfactory plot.

There was inadequate information on recovery of old stations. All stations for which geographic positions were available were plotted excepted those listed on pages 273 and 274, 6-6993. These were at Kiska Harbor and were so closely spaced that it was considered inadvisable to show them. Many of these were not described. These stations are white wash markings, white flags, prominent parts of wrecks, etc. that are unrecoverable or not permanent.
Radially plotted positions have been established for both FEN, 1948 and Sub. Pt. FEN. Since both radially plotted positions fell 1.0mm. to the west of the plotted positions it is believed the computed positions may be in error. Computed positions check. FEN is an unmarked intersection station, KANV.

Radially plotted position for NORTH HEAD, 1904, falls 7.0mm. to the north. This station was not identified by the field party and was pricked using the description. It has obviously been misidentified in the office but no attempt was made to reprick it as it was not necessary.

The remaining stations for which radially plotted positions were established were off less than 1.0mm. This is probably due to slight discrepancies in the office identification. Field identification of many were on 1935 Navy five-lens photographs and were difficult to transfer to the 1951 photographs.

24. SUPPLEMENTAL CONTROL:

Survey T-8632, scale 1:20,000, a shoreline manuscript of the southwest portion of Kiska Island, compiled in May 1949 was available. Also furnished were 1:20,000 scale planable sheets T-7077, T-7078, and T-7079 along the northeast and northwest coasts of the island.

Of the five stations whose positions were disregarded, one station, POT, 1948 was held in the radial plot. Radially plotted positions have been established for the other four, GERTY, 1948, RAG 1948, ABE 1948, and PIN 1948. The positions for the first two were established by theodolite and the other two by sextant. The positions for all five stations were obtained from the report for T-8632.

The positions for WASH 1948, FOG 1948, and FLAT 1948 which were established photogrammetrically in T-8632 could not be held in this radial plot. New positions were established.

The old positions of forms 524 were crossed off and new radial plot positions indicated in red.

Positions shown in red supersede old positions.

One new recoverable topographic station SIR 1952 was established. This was a hydrographic station which was used in 1948. The position checked with planable sheet T-7078.

25. PHOTOGRAPHY:

Photographic coverage, definition, and overlap was adequate. Vacuum failure on a couple of photographs had no serious effect on the plot nor did any of the several tilted photographs. An attempt to make a tilt determination for photograph 34205 proved futile because the three scale points which were obtained were too nearly in a straight line. Only about one third of the photograph is land area.
26. VERTICAL CONTROL:

The elevations of twelve peaks were computed. One, Peak B (from GERITY) was rejected because the two elevations obtained differed by 50 meters. The horizontal angles did not check exactly but it is believed the elevation will not be needed so no further attempt was made to identify the peak.

*Retained on map manuscript as unmarked spot elevation. Agreed with instrument elev.

Respectfully submitted

LAYOUT SKETCH
PROJECT Ph. 34(48)

- Nine lens office photographs
- Control stations (identified)
- Control stations (not held in plot)
31. Delineation:

The seven topographic quads covering Kiska Island have been delineated on the Reading Plotter, model "A". The entire area of the island has been completed in this operation; no areas have been left blank because of cloud cover, or left dashed as approximate delineation for any reason.

32. Control: see also item 23.

More than adequate control was existant for control of the radial plot; refer to side-heading 23 of the Radial Plot Report. Certain stations have been left off the manuscripts where they were too crowded or there was a doubt as to their permanency.

33. Supplemental Data:

a. Volume of Elevation Computations: Entitled,

"COMPUTATIONS OF ELEVATIONS AND TABULATIONS OF VERTICAL CONTROL POINTS FOR SURVEYS T-8633 thru T-8639."

b. Compilation Photographs:

34240 thru 34 254 (Details on page 4)

c. Shoreline manuscript T-8632 (1949), with report (1:20,000)

d. Field Sheet Index, Ship EXPLORER, 1948, 1:40,000, acetate.

e. Graphic Control Surveys:

- T-7115, 1:20,000, film positive
- T-7118a, 1:20,000, film positive
- T-7118b, 1:20,000, on film positive reduced from 1:10,000
- T-7117, 1:20,000, film positive
- T-7117, 1:20,000, on film positive reduced from 1:10,000
- T-7118a, 1:20,000, film positive
- T-7118b, 1:20,000, on film positive reduced from 1:10,000
- T-7119, 1:20,000, on film reduced from 1:10,000
- T-7071, 1:20,000, on film positive reduced from 10,000

34. Contours and Drainage:

The photographic quality of the instrument photos was only average, but usable, and the entire island was contoured leaving no areas of doubtful contouring. Some difficulty was experienced because of the unusual spacing of the photography; for the most part the spacing was too great for proper instrument functioning.

35. Shoreline and Alongshore Details:

The shoreline inspection was not altogether adequate and was variable in density of information presented; short sections would be overly detailed while others adjoining would be bare of details. Further, the inspection was accomplished over three field seasons by as many different inspectors using more than three different sets (partial) of photography (none of which were the same set used for compilation). The inspection was made in competition with inshore hydrographic work involving several graphic control surveys with which it had to conform, and therefore it is little wonder the shoreline inspection which was used was a bit difficult to interpret. However, it was used as a guide for the instrument delineation of the manuscript shoreline, which should be considered as superseding all previous surveys and compilations. No low-water line was provided, field or office, but considerable shoal and foul lines have been delineated guided partially by field inspection and graphic surveys, and partially by compilation T-8632. For the most part, the foul lines are in the form of ledges or scattered rocks—awash which form an outer barrier. None of the alongshore detail conflicts with the hydrographic surveys listed in sub-heading 33, above.

36. Offshore Details:

This compilation includes Little Kiska Island, Tanadak Island, and Sobaka Rock, all of which have been treated as being a part of Kiska Island.

37. Landmarks and Aids:

See side-heading 47. None others recommended.
38. Control for Future Surveys:
   12 Topo stations with 524 cards and 4 Hydro stations with identification cards, were located by the radial plot:
   T-8633 SIR, 1948 - 1952
   T-8634
   T-8636 POT, 1948 RAG, 1948 Cor, End, Nut, Rust
   T-8637
   T-8639

39. Junctions: All are in agreement by continuous compilation.

40. Horizontal and Vertical Accuracy:
   These quads meet the map standards for a scale of 1:20,000, and for a 50 ft contour interval. The 25 ft contours delineated are considered to meet the standards for a 25 ft interval, but the map is meant to be of 50 ft contour interval.

45. Comparison with Existing Maps:

47. Comparison with Nautical Charts:
   KISKA HARBOR, KISKA ISLAND No 9124 1:15,000
   APPROACHES TO KISKA HARBOR, RAT ISLANDS No 9155 1:50,000
   KISKA ISLAND, RAT ISLANDS No 9180 1:50,000

ITEMS TO BE APPLIED TO NAUTICAL CHARTS IMMEDIATELY: none

ITEMS TO BE CARRIED FORWARD: Landmarks:
   1. Red Bluff P A at 52°05'-177°40'
   2. Hut at 51°57'-177°42'

48. Geographic Name List: See page 16 following.

49. Notes for the Hydrographer: Not applicable.

</tbody>
</table>

There are some differences in the minor details of shoreline configuration between that shown on the above surveys and the maps of this series. These differences do not conflict with the general position of the shoreline. There are differences in the amount and extent of foreshore ledge shown between the previous surveys and this survey, but none of the differences are critical.

T-8633 to T-8639, inclusive, supersede the above surveys for nautical charting purposes.

63. **Comparison with Maps of Other Agencies.**

**Kiska Island, USE, 1:25,000, 1943**

The USE quadrangles in comparison with the maps T-8633 through T-8639 show a more generalized shoreline, the foreshore ledge is shown more extensively and the shoreline cliffs are shown by hachures rather than contours.

64. **Comparison with Contemporary Hydrographic Surveys.**

<table>
<thead>
<tr>
<th>H-6933</th>
<th>1:10,000</th>
<th>1943</th>
</tr>
</thead>
<tbody>
<tr>
<td>7644</td>
<td>1:20,000</td>
<td>1947-48</td>
</tr>
<tr>
<td>7707</td>
<td>1:10,000</td>
<td>1947-49</td>
</tr>
<tr>
<td>7708</td>
<td>1:20,000</td>
<td>1948</td>
</tr>
<tr>
<td>7712</td>
<td>1:10,000</td>
<td>1948</td>
</tr>
<tr>
<td>7712 Ad WK</td>
<td>1:10,000</td>
<td>1949</td>
</tr>
<tr>
<td>7713</td>
<td>1:10,000</td>
<td>1948</td>
</tr>
</tbody>
</table>

The maps of this project were compared with the above prior hydrographic surveys. Conflicting differences existing between the topographic surveys and the hydrographic surveys, with respect to foreshore and offshore features, have been reconciled on the topographic surveys to agree with the hydrographic surveys.
65. Comparison with Nautical Charts:

<table>
<thead>
<tr>
<th>Chart</th>
<th>Scale</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>864</td>
<td>1:300,000</td>
<td>corr. to 9/29/52</td>
</tr>
<tr>
<td>9124</td>
<td>1:15,000</td>
<td>corr. to 1/7/52</td>
</tr>
<tr>
<td>9155</td>
<td>1:50,000</td>
<td>corr. to 1/15/51</td>
</tr>
<tr>
<td>9180</td>
<td>1:80,000</td>
<td>corr. to 1/22/51</td>
</tr>
</tbody>
</table>

The maps of this series and the charts have differences in the configuration of shoreline, the size and shape of near shore rocks and elevations of peaks, but none of these minor differences are critical to navigation.

66. Adequacy of Results and Future Surveys.—These maps are adequate for use in hydrographic surveys and the construction of nautical charts. These maps meet the National Standards of Map Accuracy.

67. Foreshore Delineation.—Reference last sentence of item 35. The delineation of an outer barrier of ledge separated from the shoreline by shallow areas was revised to include the shallows as ledge. These shallows are awash at MLLW as indicated by field notes on nine-lens field photograph 21157 and are required to be shown by a ledge symbol.

Hydrography was applied to the map manuscript of this quadrangle in accordance with Division of Photogrammetry General Specifications dated 18 May 1949 and Army Map Service TM 45-14, Chapter 14.

The depths are in fathoms at mean lower low water and originate with the following surveys:

H-7596 (1947) 1:40,000
H-7644 (1949) 1:20,000

Depth curves are shown at 1, 3, 5, and 10 fathoms. Hydrography compiled by K. N. Maki and checked by O. Svendsen, 5 May 1954.

A basic hydrographic or topographic survey supersedes all information of like nature on the uncorrected chart. Give reasons for deviations, if any, from recommendations made under “Comparison with Charts” in the Review.
