DATA RECORD

T-8954 to T-8958 Incl.

Project No. (II): Ph-23(47) Quadrangle Name (IV):

Field Office (II): Coos Bay, Field Unit Chief of Party: R.A. Earle

Photogrammetric Office (III): Portland, Oregon Officer-in-Charge: Charles W. Clark

Instructions dated (II) (III): 27 February 1948 Copy filed in Division of Photogrammetry (IV)

Office Files

Method of Compilation (III): Graphic

Manuscript Scale (III): 1:10,000 Stereoscopic Plotting Instrument Scale (III):

Scale Factor (III): None

Date received in Washington Office (IV) Date reported to Nautical Chart Branch (IV):

Applied to Chart No. Date: Date registered (IV):

Publication Scale (IV):

Geographic Datum (III): N.A. 1927

Publication date (IV): (Date of issue July 1947)

Vertical Datum (III): Mean Sea Level

Mean sea level except as follows:

Elevations shown as (25) refer to mean high water
Elevations shown as (5) refer to sounding datum
i.e., mean low water or mean lower low water

Reference Station (III): See reverse side

Lat.: Long: Adjusted Unadjusted

Plane Coordinates (IV): Not shown State: Oregon Zone: South

Y =

X =

Roman numerals indicate whether the item is to be entered by (I) Field Party, (III) Photogrammetric Office,
or (IV) Washington Office.

When entering names of personnel on this record give the surname and initials, not initials only.

Number of Triangulation Stations searched for (II): 114 Recovered
Number of BMs searched for (II): 22 Recovered: 17 Identified: 3
Number of Recoverable Photo Stations established (III): 74
Number of Temporary Photo Hydro Stations established (III): None

Remarks: Some fixed aids were established subsequent to the time of field inspection. They are shown on the manuscripts as per use observations of 1950.
SUMMARY TO ACCOMPANY T-8954 THROUGH T-8958

Shoreline surveys T-8954 through T-8958 comprise project Ph-2347. They cover the shoreline and adjacent features of Coos Bay, Oregon, or approximately the area covered by Nautical Chart 5984.

These surveys were compiled by graphic methods at a scale of 1:10,000 using for most part 1949 photographs. The field inspection was accomplished in 1948 using 1947 photographs. The compilation was in accordance with the field inspection except where changes could be readily interpreted on the 1949 photographs. Also the source of the positions of some aids to navigation, which were moved subsequent to the date of the field inspection, is the U. S. Engineers. The field operations included the inspection of shoreline and adjacent features, the recovery and identification of horizontal control, the establishment of some additional horizontal control and the investigation of city boundaries.

The area covered by these surveys extends from latitude 43°10' to latitude 43°29' and westward from longitude 124°08' to the Pacific Ocean. Items registered under these survey numbers will include a cloth-mounted lithographic print of each survey manuscript at a scale of 1:10,000 and a descriptive report covering all the surveys.
1. Description of Area:

The area covered by this project lies between Latitudes 43\(^\circ\) 19' 00" and 43\(^\circ\) 29' 00"; and between Longitudes 124\(^\circ\) 08' 00" and 124\(^\circ\) 24' 00". It covers the area adjacent to Cape Arago, the entrance to Coos Bay, Coos Bay proper, the tributary sloughs and rivers, and the coast line north of the Coos Bay Entrance.

Prominent among the waterways are the Coos River and the tributary sloughs, South Slough, North Slough, Pony Slough, Heynes Inlet, Kentuck Slough, Isthmus Slough, and Catching Slough. There are a number of smaller drains and creeks which flow into the sloughs mentioned above but they are of minor importance and are not navigable.

The Coos Bay - North Bend waterfront is highly industrialized and the navigation channel is lined with lumber mills and wharves for loading the ocean going vessels which carry lumber out of the port. The area adjacent to the towns of Coos Bay and North Bend is largely industrial and residential while the balance of the project is covered with high ridges on which grows timber of varying size and type.

Topographically, the area covered by this report falls into three distinct units:

(1) The area of sand dunes and fossil sand dunes lying north of the mouth of Coos Bay and extending to the north project limit.

(2) An area of marsh or reclaimed pasture land which is adjacent to Coos Bay and its tributary sloughs.

(3) A rugged hilly area which embraces the bulk of the remaining area within the project limits.

Each of the above topographical divisions will be treated in the order listed.

(1) The area of sand dunes and fossil sand dunes extends northeasterly from the north jetty at Coos Bay Entrance, easterly to the mouth of North Slough and to the northern limits of this project. A sandy beach, inaccessible by road, fronts along the ocean for the entire length of the area. Inland from the sand beach is an area of shifting sand dunes, interspersed with numerous small intermittent ponds, and spotted here and there with coniferous trees which have survived the constant southeasterly encroachment of the dunes. This southeasterly trend is due to the prevailing northwesterly winds. The above des-
cription roughly fits all of the North Spit. Lying to the east of the area mentioned above, and west of the banks of North Slough is an area where the dunes have been captured and held in place by vegetation. This area is interlaced with small sloughs, marshes and lakes, e.g. Henderson Marsh on Horsfall Lake.

The drainage in this area is largely sub-surface due to the sandy character of the soil.

(2) The area of marsh and of reclaimed pasture land, parallels the east and north shore of Coos Bay east of Pony Point, - specifically, from the east limit of the project, on Coos River, west to the North Bend Municipal Airport and north along the eastern shore of Coos Bay to North Slough. It also parallels all the major sloughs which empty into Coos Bay.

In areas where the shoreline has not been diked or filled, the marshy condition naturally present has remained. In other areas, dikes have been erected to withstand the tidal flooding of the marsh, and the land has been converted into pasture for dairy herds. Along the sloughs tributary to the bay, tidegates and drainage ditches have been erected and the land has been converted to agricultural pursuits. In still other areas, especially in the area at Eastside and on the Coos Bay waterfront, the land has been filled by dredging and converted to industrial sites.

The drainage in this area is artificial or tidal. Without artificial drainage the area would be unsuited to human pursuits. This land was at one time covered by the waters of the bay and has been elevated by the emergence of the coast.

(3) The third unit embraces the bulk of the project area. This area is comprised of steep, mountainous slopes; densely covered by either heavy woods or by a dense cover of second growth deciduous brush and trees, interspersed with scattered conifers. Portions of the towns of Coos Bay and North Bend are within the area, while the balance of the thickly settled area falls in unit 2.

The drainage in this area is clearly defined and is largely perennial in character.

One major Highway, U.S. 101 (Oregon Coast Highway) traverses the area, running north and south. This road provides the towns of Coos Bay and North Bend with transportation ties to the towns north and south along the Pacific Coast. There is no connection east from this area and all east bound traffic must go north to Reedsport or south to
Coquille before turning east. There is a secondary highway west out of Coos Bay and also one south out of North Bend which junction at the town of Empire and lead southwesterly to Cape Arago. In addition, there is a county gravel road, passable only in good weather, which leads from the settlement of Charleston, near Coos Bay Entrance, south through the Seven Devils country to Bandon, via the Bullards Ferry.

The Southern Pacific Railroad traverses the area from North to South. This is a branch line starting in Eugene, Oregon and ending at Myrtle Point, Oregon south of Coos Bay.

There are two major towns in the area, Coos Bay (formerly known as Marshfield) and North Bend. Although these towns are supported in some measure by tourist trade, the bulk of their revenue comes from the lumber mills in the area and from the port traffic which deals almost exclusively in lumber. In addition to the major towns there are three smaller settlements, two of which, Empire and Eastside, are smaller replicas of Coos Bay and North Bend. The other, Charleston, is a fishing port.

Cape Arago Light House is at the southwestern edge of the project and is maintained by the U.S. Coast Guard Station. The light is built at the inshore end of a rocky reef which projects about 1 mile seaward. Cape Arago State Park also is in the same area.

2. Complteness of Field Inspection:

The field inspection for the clarification of detail was done in accordance with the instructions for this project, dated 27 February 1948. Within the detail limits, full planimetric detail has been shown, and outside the detail limits, the road pattern, major drainage, and public and landmark buildings were shown. See par. 66

The thickly settled portions of the towns of North Bend and Coos Bay were considered as urban, and only the public and landmark buildings were shown.

Flat layouts of the towns of Coos Bay, North Bend, and Empire were secured from civic authorities and are being submitted.

3. Interpretation of the Photographs:

A densely wooded zone of hardwoods presents a more greyish tint and a greater uniformity of tone than a corresponding area of softwood. Mixed hard and softwood trees present a light grey tone mottled by a black linear pattern. Sand is uniformly white, while brush presents a light pebbled effect.
Marsh is shown on the photographs as a mottled area, cut here and there by winding tidal sloughs and guts. In a few areas there were places where the offshore limits of marsh were indefinite. In these cases, appropriate notes were made on the photographs. Mud flats, covered at high water are visible outside the high water line.

4. **Horizontal Control:**

A thorough search has been made for all USGS triangulation stations in the area. Two additional stations, established by the Corps of Engineers in 1944 were recovered and were used in establishing a control point for the radial plot in the north end of Haynes Inlet. In addition, a USGS intersection station, HANSEN 1942, was recovered on the east edge of the project to provide control in the area.

One marked station was established by this party on the north point of the confluence of the Coos River and Coos Bay. This point was established to provide control in the area, since the cost of traversing to a photo point from COOS RIVER HILL 1889 would have been excessive. This point was marked as a topographic station, MARY 1948, due to the unorthodox method by which it was located. It is felt, however, that the point is of sufficient accuracy to be classed as 3rd order triangulation. Station is listed by Division of Geodesy as 3rd order triangulation. NR.

Recovery notes on Form 526 have been prepared for all stations recovered, including the US and USGS stations. In addition to the above mentioned stations, a recovery note was prepared for JUNE 1928, which was found along the coast at the north end of the project. This station was established by G.L.R. in 1928 but was not included in the triangulation descriptions sent from the Washington Office for this project.

See par 66.

5. **Vertical Control:**

All USGS Tidal Bench Marks were searched for within the area. Where groups of Tidal Bench Marks were recovered, only the one most readily identifiable was shown on the photographs.

Recovery notes on Form 685 have been prepared for all USGS Tidal Bench marks in the detail area.
6. Contours and Drainage:

No contouring is involved in this area. In the area of complete detail, all drainage, except for minor ditches, was located and classified in the field. Only major drainage was located outside of the area of complete detailing. This includes ponds, lakes, sloughs and marsh or wooded marsh areas. Drainage features which were indistinguishable on the photographs, were located by field measurements, either by pacing or by taping. In addition, the drainage pattern, ascertained in the field, was further checked, under the stereoscope by the field inspector. In all questionable cases, the classification of drainage was verified by local inquiry.

7. Mean High Water Line:

The mean high water line has been delineated throughout the area. In some cases chained or paced distances were used to supplement the field observation. In other places, the high water line was obscured by shadows. Here, a stereoscope was used since these areas were located where there were steep bluffs.

8. Low Water Line:

Since none of the photographs which cover this area were taken at low water, the low water line was most indefinite. For this reason no attempt was made to determine the line other than to note on the photographs the areas which were observed as mud flats during the lower stages of the tide. In some areas, this line is approximate and should not be confused with the definite line which shows on the photographs e.g. the area at the north end of the Coos Bay Highway Bridge.

9. Wharves and Shoreline Structures:

All wharves and shoreline structures were delineated and carefully noted on the photographs. Supplemental notes as required were made on the photographs.

10. Details Offshore from the High Water Line:

All dolphins, piling, obstructions to navigation, etc., were carefully noted in the field and appropriate notes were made on the photographs. In addition to the details shown on the photographs, new piling had been driven in the area north of the town of Eastside. The bulk of this piling is inaccessible due to the mud flats extending between them and the shore. The positions of the more southerly lines were established by plane table intersection. On the more northerly lines of piling, sextant fixes were taken at the beginning, the end
and at bends in the rows of piling. These fixes were plotted on Field Photograph 47-D-404, and supplemental notes are being submitted with this photograph. These fixes were checked by 1949 photographs which showed piling referred to.

11. **Landmarks and Aids to Navigation:**

   All charted landmarks have been investigated and verified as to their value when viewed from seaward. In addition, recommendations were submitted for such new landmarks as were thought to be important.

   Aids to navigation were verified and those not identifiable on the photograph were located by planetable or sextant.

   All landmarks, and aids to navigation have been submitted on Form 567.

12. **Hydrographic Control:**

   No photo hydro stations have been selected. However, in this connection, it should be noted that topographic stations, usually natural objects, were established at intervals of one a mile in all shoreline areas where triangulation stations did not fulfill the requirements for topographic control, as specified in the Hydrographic Manual.

13. **Landing Fields and Aeronautical Aids:**

   Several aeronautical landmarks were located within the limits of this project and are reported on Form 567.

   The following landing field is located in this area:

   1. **North Bend Municipal Airport.**

   This was a U.S. Naval Auxiliary Air Station with facilities for both land and sea planes. It has now been turned over to the Municipality of North Bend.

14. **Road Classification:**

   All roads have been classified in accordance with Photogrammetry Instructions No. 17, dated 9/15/47. All changes in road classification and all road ends have been shown by a tick mark. On all highways greater than two lanes in width, the number of traffic lanes has been shown.
The names and numbers of all through or major access roads in the detail area have been shown. The names and numbers of important through roads such as U.S. and State Highways were obtained from posted road or street signs or from official local sources and noted on the photographs. In the incorporated areas, the names of streets may be taken from the town layouts of North Bend, Coos Bay and Empire.

15. **Bridges:**

There are two bridges, one railroad and one highway, which span Coos Bay at North Bend. In addition, there are several bridges over the various sloughs and tributaries of the bay. The vertical and horizontal clearances, the date, type and the time of the investigation have been noted on the various field photographs. *See par. 69*

16. **Buildings and Structures:**

A complete field investigation was made of all buildings and structures within the limits of detail, with the exception of the urban areas of the towns of Coos Bay and North Bend. In these areas, the first line of buildings along the waterfront was circled and shown. In the balance of this urban area, only public and landmark buildings were delineated.

All railroads in the detail area were shown. Yards and the installations pertinent thereto were delineated.

17. **Boundary Lines and Monuments:**

This party secured official data relative to the boundaries of the following towns: Eastside, Coos Bay, North Bend and Empire. These boundaries were established on the photographs. An attempt was made to locate, with topographic accuracy, every permanently marked corner, but in many cases this proved either impossible or impractical for the following reasons:

1. Many of the old monuments have been destroyed or have not been recovered after lengthy search by the local surveyors.

2. In some cases, the recovery of the existing monumented corners would have involved an expense, either by triangulation or traverse, so as to have been completely out of keeping with their value to the manuscript.

In the case of Eastside and Coos Bay, recourse was had to the records of Mr. Burkingham who made the original surveys.
In addition, a carefully platted layout of the town of Coos Bay was purchased, from the civic authorities, which will be of value to the compilation office in this connection. A copy was made of the legal description of the city limits of Eastside, and points in this legal description have been identified on the photographs to assist the compiler.

For the town of Empire, recourse was had to the records of Mr. Bessee, who made the survey for this town. In addition, a plat is being submitted.

18. **Geographic Names:**

The investigation of Geographic names was done by a one man field party and is the subject of a special report by John H. Winniford, Photogrammetric Aid. In addition, field inspection units noted all posted names.  

* Report filed in Geographic Names Section, Division of Charts.  

19. **Power Transmission Telephone and Telegraph Lines:**

Within the detail limits, all power transmission and telephone lines have been delineated where such lines afford a definite topographic feature. All submarine cables were indicated and the clearances of all overhead crossings over navigable waterways were established by trigonometric leveling from the high water line.

20. **Lumber Industry:**

The lumber industry in this area is worthy of mention, because this industry provides the principal means of livelihood in the section.

At present the trees are cut in the area east, south and north of this project. After the tree is felled, the branches are trimmed and the trunk is cut into the desired lengths. The logs are then loaded onto large trucks which usually transport them to log dumps on the tributary sloughs mentioned in the paragraphs above. Here the logs are sorted by quality, size and species, into log rafts, or booms. These rafts are transported by water, towed by small, but powerful, tugs to the various mills to which they are consigned, or to moorings along the channel, to await sale or use in the mills.

At the mill, these rafts are broken up and the logs are put into large areas enclosed by floating booms. From these booms, the logs are rafted by hand, one by one, to the conveyor which raises the logs from the water to the saws. In the conveyor, the logs are washed.
by powerful jets of water which remove the loose bark, stones, and other material which might damage the saws.

In the larger mills, a series of large vertical band saws are used to cut the log into strips of the desired width. These strips are then laid flat on a conveyor and are moved to another series of saws which in turn cut these strips into lumber. After this, the lengths move along a conveyor to a series of circular saws which trim the boards into even foot lengths. Progressing along these conveyors, the boards move along a long flat table where they are graded as to size and quality and are removed from the table by hand and stacked.

The stacks of the various size lumber are then moved by Hysters, a special lift truck for moving lumber stacked in piles, to be planed, if such is the grade desired, or to be stacked on the wharves or loading ramps, for shipment by rail or water.

In some cases, the planed lumber is kiln dried to remove the moisture and make the lumber ready for immediate use.

All lumber is loaded on the ships by longshoremen who are highly organized, and at the time of this report, numerous mills were on short shift because of the strike which prevented the ships from loading their cargoes and caused the lumber to pile up on the docks.

Approved:

John C. Lajoye
Photogrammetric Engineer

PHOTOGRAMMETRIC PLOT REPORT
Map Manuscripts Nos. T-3954 to T-3958 Incl.
Project Ph-23(47)

21: AREA COVERED:

This radial plot includes an area immediately adjacent to the
shorelines of Coos Bay, Oregon and comprises Map Manuscripts Nos.
T-3954 to T-3958 Incl.

22: METHOD:

Methods used were similar to those described in the Photogram-
metric Plot Report for Map Manuscripts Nos. T-3960 to T-3965, Project
Ph-25(47), 1943, which is included in a combined descriptive report
for that project, except as follows:

The ratio prints of the 1949 photography contained fiducial
marks for use in correcting paper distortion and this correction was
made when drawing the templates.

Several identified horizontal control stations could not be held
and facts pertaining to these stations are discussed in this report
under side heading 23, "Adequacy of Control".

23: ADEQUACY OF CONTROL:

The field unit identified an ample number of horizontal control
stations.

Several identified stations which could not be held are as
follows: See par. 67

In T-3954

SIMPSON (USE) 1907-1945: A position of SIMPSON (USE) 1907-
1945 was not available to this office. A position of SIMPSON
(USE) 1917 was used. If this assumption was correct it is be-
lieved that an error may have been made in the field when measure-
ments were made in locating the sub-station. An intersection of
radials to the point identified for a sub-station was obtained
about 15 meters southwest of the computed position. There were
numerous other well identified stations close by this station
which were held to in the radial plot.

**Field error - discrepancy in field notes also. Date: 1917 is correct**

JARVIS UPPER RANGE REAR BEACON, 1945: It is believed that
the field identification of this station is in error. There is
doubtful evidence, on the office photographs, of a light at a
location which would hold the plotted position of the station.

* Field error - discrepancy in field notes also. Date: 1917 is correct
JARVIS UPPER RANGE FRONT BEACON, 1945: A 1949 position on Oregon State Coordinates, obtained from the U.S. Engineers Portland District Office and then changed over to geodetic position, was held to. The light was rebuilt in 1949 and the 1945 position of the U.S.C. & G.S. is believed destroyed. The 1949 position is shown on the attached Forms M-2382-12.

In T-8955

All stations identified were held to.

In T-8956

BLUFF (USE 1907), 1945: Intersection on sub-station obtained 6 meters east.

COOS HEAD 3, 1909: Intersection on sub-station obtained 10 meters east. See Revised Report # 68

FOSSIL 2, 1889: Intersection on sub-station obtained 10 meters west.

NORTH BEACH 2 (USE 1941) 1945: Intersection on sub-station obtained 10 meters east. See # 66

FLY, 1928: Intersection on sub-station obtained 50 meters southeast.

The sub-stations for these stations are believed to have been measured to points on the ground which were mistakenly identified on the photographs. Intersection of radials to the picture points identified as sub-stations were obtained at the locations indicated.

In T-8957

DRIFTWOOD (USE) 1945: The station was disregarded for horizontal control because the sub-station did not appear on the 1949 photographs.

MARSH 2 (USE) 1945: The point selected for a sub-station is believed subject to movement on the ground. An intersection of radials to the point identified was obtained 10 meters northwest of the computed position for the sub-station.

* Log at shoreline.
In T-8958

All stations identified were held to.

24: SUPPLEMENTAL DATA:

There were no graphic control surveys or other supplemental control data furnished for the area of this project.

25: PHOTOGRAPHY:

The photographs taken in 1949 furnished adequate coverage and overlap except as follows: 

See p. 46

One flight of 1947 photographs, the flight line for which runs north and south at about Longitude 124° 15', was used to supplement the 1949 photographs.

A sketch is attached showing the location of photograph centers and horizontal control stations in the area.

Approved:

Charles W. Clark
Officer-in-Charge

Respectfully submitted:

J. Edward Deal, Jr.
Cartographer

31: **Delineation:**

Graphic methods were used for the compilation.

Changes in planimetric features, since the date of field inspection, which could be determined by office examination of the 1949 photographs, were shown.

The 1947 photographs (field ratio prints) were utilized to supplement the 1949 photography where necessary.

Refer to side heading 25: "Photography" of the Photogrammetric Plot Report for additional facts pertaining to photographs in this project.

32: **Control:**

The placement and density of identified control stations were satisfactory.

Refer to side heading 23: "Adequacy of Control" of the Photogrammetric Plot Report for additional facts. Also see par. 66 & 67.

33: **Supplemental Data:**

The following, which were used to supplement the photographs are being forwarded with the map manuscripts. *Filed in General Files, Div. of Photogrammetry.*

<table>
<thead>
<tr>
<th>Map of Cocos Bay, Oregon (3 copies)</th>
</tr>
</thead>
<tbody>

<tr>
<td>Cocos Bay, Oregon (Haynes Slough) (2 copies) U.S. Engineers Scale 1:5,000</td>
</tr>
</tbody>
</table>
34: **CONTOURS AND DRAINAGE:**

Not applicable.

35: **SHORELINE AND ALONGSHORE DETAILS:**

The mean high-water line was located by the field inspection party on the 1947 photographs. The photographs were examined, with the aid of the stereoscope and the field location was refined to agree with the definite line visible on the photographs.

The reef areas along the shoreline of the Pacific Ocean south of the south jetty were delineated by office examination of the photographs, with the aid of field inspection in the area. See par. 66

All alongshore details appearing on the photographs, except those deleted by the field unit, were compiled.

Approximate low-water lines were detailed as indicated by field inspection. Refer to side heading 8: "Low-water Line" of the field inspection report.

In Map Manuscript T-8954 a new bulkhead has been built along the shoreline between Lat. 43° 24' 35" and 43° 24' 30", since the time of field inspection in the area. This new bulkhead has been compiled on an overlay from data furnished this office by the Supervisor of the Midwestern District Office, USGS. The overlay is attached to Map Manuscript T-8954. Copies of correspondence pertaining to this work are included in this report and a print of a drawing of the area submitted to the U.S. Engineers is included in the original copy of this report. See par. 71

36: **OFFSHORE DETAILS:**

There are several spoil banks in Coos Bay between Pigeon Point and Empire which are subject to change. The information shown on the map manuscript for these features was obtained from Captain Green when he visited this office during the summer of 1950.

Delimited in accordance with office interpretation of 1949 photographs. See par. 66

The rock and reef areas offshore in the vicinity of Cape Arago were very difficult to delineate because the sea breaks over most of these features in this area. See par. 66
37: LANDMARKS AND AIDS:

Forms 567 are being submitted for all Landmarks and Aids in the area of these map manuscripts.

Several of the non-floating aids have been rebuilt since the date the positions were established and also since the date of field inspection in the area. The U.S. Engineers, Portland District were consulted and furnished this office their latest positions on Oregon State Coordinates for several of these rebuilt aids. These coordinates were changed to geodetic positions and then entered on the Forms 567 being submitted. See par 68.

38: CONTROL FOR FUTURE SURVEYS:

Forms 524 are being submitted for all recoverable topographic stations distributed over the 5 map manuscripts as follows:

T-8954 - 18-15
T-8955 - 17
T-8956 - 10
T-8957 - 5*
T-8958 - 242

A list of these stations is not included in paragraph 11 of the field inspection report.

A list of recoverable topographic stations has been prepared on a separate page for each map manuscript under paragraph 49.

No photo hydro stations were established.

* Two additional Forms 524 were submitted at time of review and are listed under par. 49. See par. 70

39: JUNCTIONS:

Satisfactory junctions have been made between all map manuscripts in this project.

40: HORIZONTAL AND VERTICAL ACCURACY:

There are no areas considered to be subnormal in horizontal accuracy. Vertical accuracy is not applicable to this project. See par. 66

46: COMPARISON WITH EXISTING MAPS:

A visual comparison was made with the U.S.G.S., Coos Bay, Oreg., 30-minute quadrangle, Scale, 1:125,000, Edition of May 1900 reprinted 1937.
A visual comparison was made with U.S.G.S. Coos Bay, Oreg. 15-minute quadrangle, Scale, 1:62,500, edition of 1945.

A visual comparison was made with U.S.G.S. Empire, Oreg., 15-minute quadrangle, Scale, 1:62,500, edition of 1944.

47: COMPARISON WITH NAUTICAL CHARTS:

Office interpretation of U.S.C.&G.S. photography (1949) during the review of survey T-8954 revealed that building is almost wholly destroyed.

This form shall be prepared in accordance with Hydrographic Manual, pages 800 to 804. Positions of charted landmarks and nonfloating aids to navigation, if redetermined, shall be reported on this form. The data should be considered for the charts of the area and not by individual field surveys. For information under each column heading should be given.
Mr. A. Newton Stewart  
U.S. Coast & Geodetic Survey  
502 Panama Building  
Portland 4, Oregon

November 2, 1950

Dear Mr. Stewart:

Thank you very much for your letter of November 1, and I am sorry that I have not been able to forward to you the desired information but I have been away from the office for some three weeks with illness.

I am returning to you the Drawing 10-L-909 upon which, with a green arrow, I have indicated the approximate position of the end of the completed bulkhead. The remainder of the bulkhead will not be constructed as the distance from the low water line made it unnecessary to complete this portion. I have shown, with a blue line, the approximate high water line as sketched from the bridge, this representing the line of debris as washed up by the tide. The fill has been completed on all the bulkhead and, therefore, the bulkhead can represent the high water line.

Your reference in the last paragraph of your letter to the location of Harbor Point 104 has been checked with the engineers. It appears that the point is located incorrectly on the drawing but that the bulkhead location was established by coordinates which have the same relation to the true position of Harbor Point 104 as the bulkhead shown on the sketch.

I hope this information will be of sufficient use to you to complete your nautical charts.

Yours very truly,

WEYERHAEUSER TIMBER COMPANY

/S/

COPY

6 November 1950

To:         Director  
U.S. Coast & Geodetic Survey  
Washington 25, D.C.

Subject:    Correction to Chart 5984

There are transmitted herewith correspondence and other information relative to a correction to Chart 5984. This change was learned about through the Corps of Engineers' Public Notice, and further information was had from the Weyerhaeuser Timber Co.

A plan showing the full extent of the bulkhead was obtained from the Weyerhaeuser Company. Information concerning its south end, and the position of Pier II near the northwest end, is contained in a letter from them dated 19 September. The only information concerning the location of the extreme northwest end, the short section on the west side of the bridge between the pier and shore, is the sketch on typewriter size paper which accompanied the notice of public hearing.

Since topographic sheet T-8954 was being compiled in the Portland Photogrammetric Office from photographs taken prior to the construction of the bulkhead, information concerning this change was sent to that office. The Weyerhaeuser sketch was reduced to 1:10,000 scale on accompanying acetate sheet No. 1, and a discrepancy was found near the south end of the Old Town Mill Dock. Upon investigation it was found that on the Weyerhaeuser map the position of H.P. 104 was plotted in error. A correction in the reduction was made and is shown on accompanying acetate sheet No. 2. This seems to make the topographic features agree closely with the Photo Office compilation. A tracing of the latter is being forwarded, and acetate sheets may be laid over it for comparison.

It is noted in the last paragraph of the Weyerhaeuser letter dated 19 September that the extent of completion of the south end of the bulkhead is in doubt. Further inquiry was made. The reply failed to give direct answer to questions, but by inference the south end appears to be complete. However, the reply did give information concerning a change in the northwest end of the bulkhead. Lieut. Comdr. Clark is being informed of this. The change on acetate sheet No. 2 forwarded herewith should be made in the Washington Office.

A. Newton Stewart

Except for the area westward from Yoakam Point, appropriately labeled on T-8956, the surveys of this project supersede these prior surveys for nautical charting purposes for common areas. It was noted that some shoreline has changed considerably near the entrance to Coos Bay since the dates of these prior surveys (i.e., Bastendorff Beach built-up by approximately 200 meters). See also par. 66.

63. Comparison with Maps of Other Agencies:

- Coos Bay, Oregon (USGS) 1:62,500 1945
- Empire, Oregon (C.of.E.) 1:50,000 1947

64. Comparison with Contemporary Hydrographic Surveys:

None

65. Comparison with Nautical Charts:

5984 1:20,000 Apr.1947 corr. to 50-10/30

This chart shows a cable area in Isthmus Slough which was not field inspected. Also the cable area opposite Empire appears in disagreement. The field party located only the western end of the submerged cable and indicated a direction of the crossing. The position of the western end as shown by survey T-8957 agrees with the chart but the direction does not. Evidence of an error in the chart is not conclusive.

These surveys show various changes in low-water areas and reclaimed marsh land. See par. 66.
Adequacy of Results and Future Surveys:

It was noted during this review that the area along the Pacific Ocean southwesterly from Yoakam Point on T-8956 was largely in disagreement with prior surveys and maps. The field inspection of the area appeared incomplete in comparison with these sources and the 1949 photographs and was accomplished using a photograph with poor definition and with much of the shoreline detail obscured by breakers. Also photographic coverage and density of control were inadequate to insure an accurate radial plot for the area. This area has been appropriately indicated on the manuscript.

The use of triangulation station June 1928 for controlling the radial plot along the Pacific Ocean at the north limit of the project might be questioned. The Division of Geodesy did not publish the position of this station because difficulty was experienced in adjusting the 1928 triangulation for this area. However, the radial plot was not extended far from a well-controlled area to reach this station and no weaknesses were noted. Also the 1928 stations were used for controlling Survey No. T-41419 which was the most recent survey of this area. Consequently, Survey No. T-8954 of this project should be used for nautical charting of this area.

The field inspection was not complete for offshore features. Also the surveys are incomplete for low-water areas (See par. 31). Features office-interpreted on the 1949 photographs include some spoil areas (T-8956 and T-8957) shown in part with mean high-water line. These areas, however, are subject to frequent changes by dredging operations.

Except details noted above, these surveys meet the National Standards of Map Accuracy and comply with project instructions. Details below the plane of mean high-water are subject to change or verification by hydrographic surveys.

Control:

Reference: Paragraph 23.
T-8954

It was noted during this review that station "Coos Bay Lumbar Co., stack, 1945" fitted the identification sketch while station "Coos Bay Pulp Corporation, stack, 1945" did not. The position for station Simpson (USE 1917) 1945 sub. pt. was recomputed referencing to this former station and the computed position plotted within 0.3 mm. of the radial plotted position. Referencing the computation to station "Coos Bay Pulp Corporation, stack, 1945" gave a position for the
sub. pt. which plotted approximately 85 meters from the
radial plotted position, not 15 meters as noted in para-
graph 23.

The office identified point for station "Jarvis Upper
Range Rear Beacon, 1945" agrees more closely with the field
identification sketch and has characteristics more like a
light than does the point identified in the field. The two
points are approximately 25 meters apart.

T-8956

Other identifiable photograph points fell at the com-
puted positions of substitute points for stations "Coos Head 3,
1907" and "Fly 1928", indicating identification errors by the
field party.

The 1949 photographs differ with the 1947 field photo-
graphs to the extent that the substitute point for station
"North Beach 2 (USE 1941) 1945" could not be positively
identified.

The substitute point for station "Fossil 2, 1889"
appeared correctly identified but the radial plotted position
was in disagreement along the computed direction to the sub.
pt. indicating a 10-meter error in the measured distance.

The substitute point for station "Bluff (USE 1907) 1945"
could not be positively identified on the 1949 photographs
but station "Coos Bay Entrance Range Rear Beacon 1945" which
was positively identified and was only approximately 40 meters
distant held in the plot.

All of the above stations are in an area which has an
abundance of control all of which held to form a strong
radial plot.

T-8957

The radial plotted position for the substitute point for
station "Knese 2 (USE) 1945" was in disagreement with the com-
puted position along the observed direction for the sub. pt.
indicating the possibility of a 10-meter error in measured
distance. Other control in the area held.

68. Landmarks and Aids:

Forms 567 submitted by the field party did not include
"CUP" and "HOTEL" in the City of North Bend. Office inter-
pretation of the 1949 photographs during this review revealed
that "CUP" has been destroyed. Another Form 567 was submitted to the Nautical Chart Branch, copy of which is attached. Landmark "HOTEL" appeared on the 1949 photographs but it may have lost its value as a landmark by the erection of other buildings in the area.

The compiler had shown the two lights of the Ferndale Lower Range (on T-8955) at positions as furnished by the U. S. Engineers (1948). It was noted during this review that the compiled range fell in an obstructed area. The lights were office-interpreted on the 1949 photographs and a new position was determined for Ferndale Lower Range, Rear Light. Using this position, the range plots in the channel. A new Form 567 was submitted to the Nautical Chart Branch, copy of which is attached.

69. Bridges:

The U.S. Bridge Book shows the Kentuck Inlet highway bridge as bascule type whereas the field party shows it as a fixed bridge. The Bridge Book shows the horizontal clearance as 32 feet; the field shows 35.6 feet.

The vertical clearance of the U.S. 101 highway bridge at North Bend was not furnished by the field party.

70. Topographic Stations:

Forms 524 were submitted at the time of this review for two stations named "Concrete Pier, 1948" both of which are on Survey T-8957. Forms are filed in General Files, Division of Photogrammetry.

71. Shoreline and Alongshore Details:

The overlay referred to in paragraph 35 showing the construction of a new bulkhead at North Bend was compared during this review with Survey T-8954. A discrepancy of approximately 10 meters exists for the south end of the bulkhead which could not be resolved. This bulkhead was not included as part of this survey because the same data are available to the Division of Charts for chart construction and is included in Nautical Chart Letter 878 (1950).

---

A basic hydrographic or topographic survey supersedes all information of like nature on the uncorrected chart.

Give reasons for deviations, if any, from recommendations made under "Comparison with Charts" in the Review.
