FIELD INSPECTION REPORT

T 9690 thru T 9695

The field inspection report for the entire project is included in the report for T 9679.
21. AREA COVERED

This radial plot covers the area of Surveys T-9691, T-9692 and T-9694 thru T-9697. These surveys cover the area between Kakechik River and Ningaluk River in Hazen Bay on the west coast of Alaska. The surveys will be compiled with the Reading Plotter.

22. METHOD - RADIAL PLOT

Map manuscripts:
Vinylite sheets with polyconic projections in black and Universal Traverse Mercator grids in red, at a scale of 1:20,000, were furnished by the Washington Office.

All control stations and substitute stations were plotted using the beam compass and meter bar.

A sketch showing the layout of these surveys and the distribution of photograph centers and control is attached to this report.

Photographs:
All photographs used were nine-lens metal mounted photographs at a scale of 1:20,000. Thirty-eight (38) photographs were used in the plot - numbered as follows:
- 28511 thru 28519
- 28813 thru 28852
- 38063 thru 38092
- 38096 thru 38107

Templets:
Vinylite templets were made from all photographs using a master templet to adjust for errors due to chamber displacements. Radial lines were scratched on the templets and scratches were filled in with china marking pencils. Red pencil was used for all shoreline (Rectification) pass points and, black pencil was used for all other radial lines.

Closure and Adjustment to Control:

This radial plot was laid directly on the map manuscripts beginning with photograph 38083 and continuing southeasterly to photograph 38092. Then the flight starting with photograph 38107 was laid extending it southeasterly to photograph 38096. These two flights were continuous and adequately controlled; and, offered a good base for adding the two flights 28843 thru 28852 and 28511 thru 28519 to the west.

The flights laid for this plot resulted in a rigid plot. No difficulty was encountered in extending from the previous plot for surveys T-9686 thru T-9690 and T-9693 to the north and east of this plot to control station INLET, 1951; SLUMP, 1951; and FRONT, 1951 at the southern end of this plot.
22. **METHOD - RADIAL PLOT (cont'd)**

   **Closure and Adjustment to Control: (cont'd)**

   An effort was made to extend this plot to the southerly end of the flights laid as listed under sub-paragraph headed "PHOTOGRAPHS", and to effect a tie between these north-south flights and flight 28522 thru 28528 which is an east-west flight. However, control station GRASS, 1951 and PATCH, 1951 could not be held. This difficulty could not be resolved without the addition of more map manuscripts and flights of photographs for which the plot table was not large enough. For this reason, the plot was stopped at control stations which could be held with certainty. The pass points and photograph centers were pricked off only to the southern limits of surveys T-9696 and T-9697. It is felt that the positions of these pass points are all within the standards of accuracy and that the difficulty in the area around GRASS, 1951 and PATCH, 1951 will be resolved to the next plot.

   **Transfer of Points:**

   The position of all centers, pass points and control stations were pricked on the top templates and circled with a 3 mm circle. They were then established on the remaining templates and map manuscripts by drilling down through them with a small (.01 inch) jeweler's drill. All points were circled on each remaining template as it was removed, and finally on the map manuscripts.

23. **ADEQUACY OF CONTROL**

   The horizontal control was adequate for a satisfactory radial plot in the area covered by this report. All control stations were held.

24. **SUPPLEMENTAL CONTROL**

   None

25. **PHOTOGRAPHY**

   The definition of the photographs was good, and the coverage was adequate for the area of this report.

   Though several tilted photographs were used in this plot, no tilt determination was necessary because the degree of tilt was not enough to affect the plot.

   One of the fiducial marks was missing in chamber 4 and one in chamber 8 on all the 1952 photographs.

   Some conjugate centers were pricked in the Washington Office before the photographs were received in this office. It was noted that many of the circles were not round as if made by a faulty pen. Those circles on conjugate centers in line of flight were corrected.
26. VERTICAL CONTROL

No field identified V-points in this area were pricked in the office because there are sufficient shoreline pass points for rectification, and V-points are all in marsh.

The elevation of STUMP, 1951 is 4.8 meters (16 feet). In a stereoscopic study of the area, this elevation appears to be too high. *See Compilation Report 7-1956

27. RECOVERABLE TOPOGRAPHIC STATIONS

The positions of all recoverable topographic stations which were identified were established in the radial plot. Those identified by a substitute point were plotted with a steel protractor and meter bar before the map manuscripts were disassembled.

31. **Delineation**

The manuscripts were delineated graphically and on the Reading Nine-lens plotters. The MHWL on the coastline and major streams was delineated on the Reading Plotters, all other hydrographic features were delineated directly onto the manuscript from rectified photos using the radial plot pass points for orientation. The eastern halves of T-9692 and T-9695 were not compiled because of the lack of photography.

32. **Control**

See radial plot for report on horizontal control. The vertical control was adequate. There were sufficient tide water streams to orient the stereo models without the use of the elevations furnished by the field party.

33. **Supplemental Data - None**

34. **Contours and Drainage**

The entire area of the manuscripts is below the elevation of the lowest supplemental contour.

35. & 36. **Shoreline Alongshore & Offshore Details**

The field inspection of the shoreline was adequate. The approximate L.W.L., which was not field inspected, was in most areas delineated from the 29,000 series photos which were taken near the time of low tide. No low water photography was available for the outer coast shoreline from Long. 165°05' to Lat. 61°09'.

37. **Landmarks and Aids: None**

38. **Control for Future Survey**

Forms 524 were submitted for the following topographic stations whose positions were obtained photogrammetrically:

39. **Junction:**

Junctions were made with all contemporary surveys shown on the index.
40. **Horizontal and Vertical Accuracy**

   The horizontal positions of all detail points are within the accuracy requirements. Due to the plethora of tide water streams the spot elevations are well within the accuracy requirements.

46. **Comparison with Existing Maps**

   The area of these manuscripts is covered by the following 1:250,000 scale USGS maps: HOOPER BAY 1951 and MARSHALL, 1951.

47. **Comparison with Nautical Charts**

   The largest scale Nautical Chart of the area is No. 9302.

   Items to be applied to Nautical Charts Immediately: none.

   Items to be carried forward: none.

Notes to Hydrographer

T-9690 thru T-9695

The following topographic stations were established in the field and their positions determined photogrammetrically:

- T-9690 - July, 1951
- T-9691 - none
- T-9692 - none
- T-9693 - Dope 1951
- T-9694 - Kulu, 1951; Oral, 1951
- T-9695 - none

No photo hydro stations were established.
62. **Comparison with Registered Topographic Surveys**

There are no registered topographic surveys of this area.

63. **Comparison with Maps of other Agencies**

See Item 46.

64. **Comparison with Contemporary Hydrographic Surveys**

There are no contemporary hydrographic surveys of this area.

65. **Comparison with Nautical Charts**

9302  1:1,534,076  1952 corr. to 12-24-56

This is the only Nautical Chart covering all topographic surveys of this project.

66. **Adequacy of Results and Future Surveys**

Shoreline inspection appears adequate. Lack of inshore inspection may have resulted in minor errors in office interpretation. Other than these, no deficiencies in accuracy and adequacy were indicated.

Summary to Accompany Topographic Maps T-9690 thru T-9695

The six (6) sheets of this combined report of project Ph-24090 (6056) are in the Hazen Bay area, Bering Sea. See accompanying project index.

The subject manuscripts were compiled graphically - direct from rectified photographs for extensive marsh areas - and on the Reading Nine Lens Plotters for balance of details.

Maximum ground elevation will be indicated on all final registration copies - the entire area being lower than the 25 feet supplemental contour.

There are no previous topographic surveys - nor contemporary hydrographic surveys of the subject area.

The Army Map Service will publish the four (4) westerly manuscripts as standard topographic quadrangles at the scale of 1:50,000 (see accompanying project index).

A "Cronar" film positive at manuscript scale and the descriptive report, as well as a cloth-backed print of the two AMS quadrangles in color after final printing, will be registered and filed in the Bureau Archives.

Topographic Mapping Project 6056 240.90

Alaska-Bering Sea, Scammon Bay to Kuskokwim Bay and Nunivak Island

Official Mileage for Cost Accounts

Sheet No. Area sq.miles

Compiled 1:20,000 scale, from 1:20,000 scale nine-lens photographs taken August 1950 and June, 1951; additional nine-lens photography to be taken Season 1952.

(Refer to Air-Photo Indexes B-42, 50, 51, 52 and E-11)

A basic hydrographic or topographic survey supersedes all information of like nature on the uncorrected chart. Give reasons for deviations, if any, from recommendations made under "Comparison with Charts" in the Review.
